
dotfiles Documentation

Release 0.8.0

Wes Turner

August 04, 2015

1	Dotfiles	1
1.1	Goals	1
1.2	Installation	1
1.3	Quickstart	3
1.4	Further Dotfiles Resources	4
2	Usage	7
2.1	bootstrap_dotfiles.sh	7
2.2	Makefile	7
2.3	Bash	7
2.4	Vim	20
2.5	I3wm	32
2.6	Scripts	35
3	Venv	39
3.1	Working With Venv	39
3.2	Other scripts with venv-style paths	47
4	Tools	49
4.1	Packages	49
4.2	Version Control Systems	57
4.3	Anaconda	60
4.4	Awk	60
4.5	Bash	61
4.6	Binutils	61
4.7	C	62
4.8	C++	62
4.9	Clang	62
4.10	Compiz	63
4.11	CoreOS	63
4.12	Docker	63
4.13	Docutils	63
4.14	Fortran	64
4.15	Filesystem Hierarchy Standard	64
4.16	GCC	64
4.17	Gnome	64
4.18	Go	65
4.19	Grep	65

4.20	Htop	65
4.21	I3wm	65
4.22	IPython	65
4.23	Java	67
4.24	JavaScript	67
4.25	Jinja2	67
4.26	JSON	67
4.27	KDE	69
4.28	Libc	69
4.29	Libcloud	70
4.30	Libvirt	70
4.31	Linux	70
4.32	LLVM	71
4.33	Make	71
4.34	MessagePack	72
4.35	Node.js	72
4.36	OS X	72
4.37	Packer	72
4.38	Perl	73
4.39	Python	73
4.40	Pyline	77
4.41	Pyrpo	77
4.42	Readline	77
4.43	ReStructuredText	78
4.44	Ruby	78
4.45	Salt	79
4.46	Sed	80
4.47	Sphinx	81
4.48	Tox	82
4.49	Ubuntu	82
4.50	Vagrant	82
4.51	Vim	84
4.52	VirtualBox	85
4.53	Virtualenv	85
4.54	Virtualenvwrapper	86
4.55	Wayland	87
4.56	YAML	87
4.57	ZSH	88
4.58	X11	88
5	Dotfiles API	89
5.1	Subpackages	89
6	Developing	109
6.1	Create a virtualenv with virtualenvwrapper	109
6.2	Install this package	109
6.3	Test and build this package	109
7	Changelog	111
7.1	0.01	111
8	Git Commit Log	113
9	License	171

10 Indices and tables	173
Python Module Index	175

GitHub | Documentation | ReadTheDocs

1.1 Goals

- Streamline frequent workflows
- Configure Bash, ZSH, and Vim
- Configure Python, pip, virtualenv, virtualenvwrapper
- Configure IPython
- Configure Gnome
- Configure i3wm
- Support Debian Linux, Ubuntu Linux, OSX
- Document commands and keyboard shortcuts
- Create a productive working environment

1.2 Installation

1.2.1 Requirements

Project requirements are installed by `bootstrap_dotfiles.sh` and, optionally, also the `Makefile`.

- *Bash, Git, Python, Pip*

1.2.2 Install the dotfiles

Source: <https://github.com/westurner/dotfiles>

Documentation: <https://westurner.github.io/dotfiles/>

The `bootstrap_dotfiles.sh` shell script:

- clones the `dotfiles` and `dotvim` repositories

- creates symlinks from HOME to `__DOTFILES`,
- installs the dotfiles Python package,
- installs additional requirements with *Pip*

```
wget bootstrap_dotfiles.sh
bash ./scripts/bootstrap_dotfiles.sh -I -R
```

Create a *Virtualenv* with *Virtualenvwrapper* named “dotfiles”:

```
# Install virtualenvwrapper
pip install virtualenvwrapper # apt-get install python-virtualenvwrapper
source $(which 'virtualenvwrapper.sh') # 07-bashrc.virtualenvwrapper.sh

export WORKON_HOME="$~/-wrk/-ve27" # __WRK/-ve python2.7
mkdir -p $WORKON_HOME

# Create a virtualenvwrapper virtualenv
mkvirtualenv dotfiles # workon dotfiles
mkdir $VIRTUAL_ENV/src
cd $VIRTUAL_ENV/src

# Clone the dotfiles git repository
branch="master" # stable
# branch="develop" # development
git clone ssh://git@github.com:westurner/dotfiles -b ${branch}
cd dotfiles

# Install dotfiles pkg, symlinks, and extra pip requirements
scripts/bootstrap_dotfiles.sh -I -R # -I calls -S
```

With Python builds that haven’t set a prefix which is writeable by the current user, you can also install into `~/ .local` with `pip --user`:

```
# (Optional) Also install pkg and reqs into ~/.local/bin (pip --user)
# scripts/bootstrap_dotfiles.sh -I -R -u
```

Note: See *Quickstart*, which uses venv-style paths.

1.2.3 Source the dotfiles

- Bash (and ZSH) configuration sets are sequentially numbered 00-99.
`00-bashrc.before.sh` sources a documented, numerically sequential sequence of bash scripts.
- ZSH loads much of the standard Bash configuration and oh-my-zsh.
`00-zshrc.before.sh`
- `bootstrap_dotfiles.sh -S` installs dotfiles `${__DOTFILES}` symlinks.

```
ln -s ~/dotfiles/etc/.bashrc ~/.bashrc
ln -s ~/dotfiles/etc/.zshrc ~/.zshrc
```

```
# Source the dotfiles
source ~/.bashrc # source ~/.zshrc

# source $__DOTFILES/etc/.bashrc
```

```
## source ${__DOTFILES}/etc/bash/00-bashrc.before.sh      # dotfiles_reload
### dotfiles configuration sequence                        # (\d\d)-bashrc.(.*)sh
#### source ${__DOTFILES}/etc/bash/99-bashrc.after.sh
##### source ${__PROJECTSRC}                            # ${__WRK}/.projectsrc.sh

# print venv configuration
dotfiles_status
ds
```

```
Last login: Tue Dec  2 15:01:56 on ttys000
#
# dotfiles_reload()
#ntid _TERM_ID="#SElGeTf5VcA"  #_USRLOG="/Users/W/-usrlog.log"
# dotfiles_status()
HOSTNAME='nb-mbl'

__WRK='/Users/W/-wrk'
PROJECT_HOME='/Users/W/-wrk'
WORKON_HOME='/Users/W/-wrk/-ve'
VIRTUAL_ENV_NAME=''
VIRTUAL_ENV=''
_SRC=''
_APP=''
_WRD=''
_USRLOG='/Users/W/-usrlog.log'
_TERM_ID='#SElGeTf5VcA'
PATH='/Users/W/.local/bin:/Users/W/-dotfiles/scripts:/usr/sbin:/sbin:/bin:/usr/local/bin:/usr/bin:/opt/bin'
__DOTFILES='/Users/W/-dotfiles'
#
# cd /
#SElGeTf5VcA W@nb-mbl:/
$
$ stid 'dotfiles'
#stid _TERM_ID="dotfiles"  #_TERM_ID__="dotfiles install"  #_USRLOG="/Users/W/-usrlog.log"
# stid 'dotfiles'
dotfiles W@nb-mbl:/
$
```

1.2.4 Upgrade the dotfiles

```
# check for any changes to symlinked dotfiles
cdd                                     # cddotfiles
git status && git diff                 # gsi ; gitw diff

# pull and upgrade dotfiles and dotvim
scripts/bootstrap_dotfiles.sh -U
```

1.3 Quickstart

This is a verbose example of installing and working with a `VIRTUAL_ENV` in `WORKON_HOME` named “dotfiles”.

See [Install the dotfiles](#) for more terse installation instructions.

```
# clone and install dotfiles and dotvim
# with venv-style paths (_SRC, _APP, _WRD)

# __WRK          -- base path for workspace          [venv]
__WRK="$HOME/-wrk"
cd $__WRK          # cdwrk          [venv]

# WORKON_HOME    -- path to virtualenv dirs  [virtualenvwrapper]
WORKON_HOME="$__WRK/-ve27" # ~/-wrk/-ve27
test -d ${WORKON_HOME} || mkdir -p ${WORKON_HOME}
cd $WORKON_HOME    # cdworkonhome cdwh cdve          [venv]

# VIRTUAL_ENV_NAME -- basename for VIRTUAL_ENV          [venv]
VIRTUAL_ENV_NAME="dotfiles"

# VIRTUAL_ENV    -- current virtualenv path          [virtualenv]
VIRTUAL_ENV="$${WORKON_HOME}/${VIRTUAL_ENV_NAME}"
cd $VIRTUAL_ENV    # cdv cdvirtualenv [venv, virtualenvwrapper]

# _SRC           -- basepath of source repositories (e.g. for pip)
_SRC="$${VIRTUAL_ENV}/src"
cd $_SRC          # cdsrc cds          [venv]

# _APP           -- basename of current working directory [venv]
_APP="dotfiles"

# _WRD          -- working directory path          [venv]
_WRD="$$_SRC/$_APP" # cdwrk cdw          [venv]

git clone https://github.com/westurner/dotfiles $_WRD
git clone https://github.com/westurner/dotvim ${_WRD}/etc/vim
cd $_WRD          # cdwrk cdw          [venv]

# __DOTFILES     -- symlink root for current dotfiles  [venv]
__DOTFILES="$${HOME}/-dotfiles"
ln -s $_WRD $__DOTFILES
ls ~/-dotfiles
cd $__DOTFILES    # cddotfiles cdd          [venv]

## Install the dotfiles
$_WRD/scripts/bootstrap_dotfiles.sh -h # help
$_WRD/scripts/bootstrap_dotfiles.sh -I # or: make install
$_WRD/scripts/bootstrap_dotfiles.sh -S # or: make install_symlinks
```

See: [Usage](#) and [Venv](#) for further documentation.

1.4 Further Dotfiles Resources

- <https://dotfiles.github.io/>
- <https://westurner.github.io/wiki/workflow>
- <https://westurner.github.io/dotfiles/>
 - <https://westurner.github.io/dotfiles/usage.html>
 - <https://westurner.github.io/dotfiles/usage.html#bash>

- <https://westurner.github.io/dotfiles/usage.html#vim>

Usage

- Install the dotfiles with *bootstrap_dotfiles.sh*
- Develop with the *Makefile* (*Make*)
- Shell with *Bash* (*Bash*, *ZSH*)
- Edit text files with *Vim* (*Vim*)
- Manage windows on *Linux* platforms with *I3wm* (*I3wm*)
- Script all the things

2.1 bootstrap_dotfiles.sh

https://github.com/westurner/dotfiles/blob/master/scripts/bootstrap_dotfiles.sh

bash scripts/bootstrap_dotfiles.sh -h:

```
$ bash $_WRD/scripts/bootstrap_dotfiles.sh -h
bash: /scripts/bootstrap_dotfiles.sh: No such file or directory
```

2.2 Makefile

<https://github.com/westurner/dotfiles/blob/master/Makefile>

make help:

```
$ cd $_WRD && make help
make: *** No rule to make target `help'.  Stop.
```

2.3 Bash

<https://github.com/westurner/dotfiles/blob/master/etc/.bashrc>

<https://github.com/westurner/dotfiles/blob/master/etc/bash/00-bashrc.before.sh>

make help_bash_rst:

```
##### etc/bash/00-bashrc.before.sh
## 00-bashrc.before.sh      -- bash dotfiles configuration root
# source ${__DOTFILES}/etc/bash/00-bashrc.before.sh    -- dotfiles_reload()
#
# dotfiles_reload()  -- (re)load the bash configuration
# $__DOTFILES (str): -- path to the dotfiles symlink (~/.dotfiles)
#
## 01-bashrc.lib.sh        -- useful bash functions (paths)
# lspath()              -- list every file along $PATH
# realpath()            -- readlink -f (python os.path.realpath)
# walkpath()            -- list every directory along ${1:-"."}
#
## 02-bashrc.platform.sh   -- platform things
# detect_platform()     -- set $__IS_MAC or $__IS_LINUX
## 03-bashrc.darwin.sh
#
## 04-bashrc.TERM.sh       -- set $TERM and $CLICOLOR
#
## 05-bashrc.dotfiles.sh   -- dotfiles
# $__DOTFILES (str): -- path to the dotfiles symlink (~/.dotfiles)
# dotfiles_status()      -- print dotfiles variables
# ds()                   -- print dotfiles variables
#
## 06-bashrc.completion.sh -- configure bash completion
#
# python: pip, virtualenv, virtualenvwrapper
# $PROJECT_HOME (str): path to project directory (~/.wrk)
# $WORKON_HOME (str): path to virtualenvs directory (~/.wrk/.ve)
# $VIRTUAL_ENV (str): path to current $VIRTUAL_ENV
#
## 07-bashrc.python.sh     -- python
# _setup_pyenv()          -- setup pyenv paths (manual)
# _setup_conda()          -- setup conda paths (manual)
#
## 07-bashrc.virtualenvwrapper.sh -- virtualenvwrapper
# backup_virtualenv($VENVSTR) -- backup $WORKON_HOME/$VENVSTR -> ./-bkp/$VENVSTR
# backup_virtualenvs()      -- backup $WORKON_HOME/* -> ./-bkp/*
# rebuild_virtualenv($VENVSTR) -- rebuild $WORKON_HOME/$VENVSTR
# rebuild_virtualenvs()     -- rebuild $WORKON_HOME/*
# TODO: restore
#
## 08-bashrc.gcloud.sh     -- gcloud: Google Cloud SDK
# _setup_google_cloud()   -- setup google cloud paths
#
## 10-bashrc.venv.sh       -- venv: virtualenvwrapper extensions
# $__PROJECTSRC (str): script to source (${PROJECT_HOME}/.projectsrc.sh)
# $VIRTUAL_ENV_NAME (str): basename of current $VIRTUAL_ENV
# $_APP (str): $VIRTUAL_ENV/src/${_APP}
# we() -- workon a new venv
#   $1: VIRTUAL_ENV_NAME [$WORKON_HOME/${VIRTUAL_ENV_NAME}=$VIRTUAL_ENV]
#   $2: _APP (optional; defaults to $VIRTUAL_ENV_NAME)
#   we dotfiles
#   we dotfiles etc/bash; cdw; ds; ls
#
## 11-bashrc.venv.pyramid.sh -- venv-pyramid: pyramid-specific config
#
```

```

## 20-bashrc.editor.sh      -- $EDITOR configuration
# $_EDIT_ (str): cmdstring to open $@ (file list) in current editor
# $EDITOR_ (str): cmdstring to open $@ (file list) in current editor
#
## 20-bashrc.vimpagers.sh   -- $PAGER configuration
# $PAGER (str): cmdstring to run pager (less/vim)
# lessv()    -- open in vim with less.vim
#             VIMPAGER_SYNTAX="python" lessv
# lessg()    -- open in a gvim with less.vim
#             VIMPAGER_SYNTAX="python" lessv
# lesse()    -- open with $EDITOR_
#
## 30-bashrc.usrlog.sh      -- $_USRLOG configuration
# $_USRLOG (str): path to .usrlog command log
# stid       -- set $TERM_ID to a random string
# stid $name -- set $TERM_ID to string
# note       -- add a dated note to $_USRLOG [_usrlog_append]
# usrlogv    -- open usrlog with vim:  $VIMBIN + $_USRLOG
# usrlogg    -- open usrlog with gvim: $GUIVIMBIN + $_USRLOG
# usrloge    -- open usrlog with editor:$EDITOR + $_USRLOG
# ut         -- tail $_USRLOG
# ug         -- egrep current usrlog: egrep $@ $_USRLOG
# ugall      -- egrep $@ $__USRLOG ${WORKON_HOME}/*/*.usrlog
# ugrin      -- grin current usrlog: grin $@ $_USRLOG
# ugrinall   -- grin $@  $__USRLOG ${WORKON_HOME}/*/*.usrlog
# lsusrlogs  -- ls -tr  $__USRLOG ${WORKON_HOME}/*/*.usrlog
#
## 30-bashrc.xlck.sh        -- screensaver, (auto) lock, suspend
#
## 40-bashrc.aliases.sh     -- aliases
## 42-bashrc.commands.sh    -- example commands
#
## 50-bashrc.bashmarks.sh   -- bashmarks: local bookmarks
#
## 70-bashrc.repos.sh       -- repos: $__SRC repos, docs
#
## 99-bashrc.after.sh       -- after: cleanup
# dr()  -- dotfiles_reload
# ds()  -- print dotfiles_status()

#### etc/bash/01-bashrc.lib.sh
### bashrc.lib.sh
## bash
# echo_args      -- echo $@ (for checking quoting)
# function_exists() -- check whether a bash function exists
# add_to_path     -- prepend a directory to $PATH
#     instead of:
#         export PATH=$dir:$PATH
#         add_to_path $dir
# lightpath()    -- display $PATH with newlines
# lspath()       -- list files in each directory in $PATH
# lspath_less()  -- lspath with less (color)
## file paths
# realpath()     -- print absolute path (os.path.realpath) to $1
#                 note: OSX does not have readlink -f
# path()         -- realpath()
# walkpath()     -- walk down path $1 and $cmd each component

```

```
# $1: path (optional; default: pwd)
# $2: cmd (optional; default: 'ls -ald --color=auto')
# ensure_symlink() -- create or update a symlink to $2 from $1
#                   if $2 exists, backup with suffix $3
# ensure_mkdir()   -- create directory $1 if it does not yet exist

#### etc/bash/02-bashrc.platform.sh
### bashrc.platform.sh
# detect_platform() -- set $__IS_MAC or $__IS_LINUX according to $(uname)
# j()               -- jobs
# f()               -- fg %$1
# b()               -- bg %$1
# killjob()         -- kill %$1

#### etc/bash/03-bashrc.darwin.sh
### bashrc.darwin.sh
# softwareupdate      -- install OSX updates
# | Docs: https://developer.apple.com/library/mac/documentation/Darwin/Reference/ManPages/man8/softwareupdate.8.html
# softwareupdate -l    # --list
# softwareupdate -i --all # --install --all
# softwareupdate -i -r  # --install --recommended
# if $__IS_MAC:
#   finder()          -- open Finder.app
#   finder-killall()  -- close all Finder.app instances
#   finder-restart()  -- close all and start Finder.app
#   finder-show-hidden() -- show .hidden files in Finder.app
#   finder-show-hidden() -- show .hidden files in Finder.app

#### etc/bash/04-bashrc.TERM.sh
### bashrc.TERM.sh
# configure_TERM      -- configure the $TERM variable (man terminfo)
# $1: (optional; autodetects if -z)
# configure_TERM_CLICOLOR -- configure $CLICOLOR and $CLICOLOR_256
#   CLICOLOR=1
# configure_TERM when sourced

#### etc/bash/05-bashrc.dotfiles.sh
### bashrc.dotfiles.sh
# dotfiles_add_path() -- add ${__DOTFILES}/scripts to $PATH
# dotfiles_status()   -- print dotfiles_status
# ds()                 -- print dotfiles_status

#### etc/bash/70-bashrc.repos.sh
### 70-bashrc.repos.sh
#
#
#
# Use Cases
# * Original: a bunch of commands that i was running frequently
```

```

# before readthedocs (and hostthdocs)
# * local mirrors (manual, daily?)
# * no internet, outages
# * push -f
# * (~offline) Puppet/Salt source installs
# * bandwidth: testing a recipe that pulls a whole repositor(ies)
# * what's changed in <project>'s source dependencies, since i looked last
#
# Justification
# * very real risks for all development projects
# * we just assume that GitHub etc. are immutable and forever
#
# Features (TODO) [see: pyrpo]
# * Hg <subcommands>
# * Git <subcommands>
# * Bzr <subcommands>
# * periodic backups / mirroring
# * gitweb / hgweb
# * mirror_and_backup <URL>
# * all changes since <date> for <set_of_hg-git-bzr-svn_repositories>
# * ideally: transparent proxy
# * +1: easiest
# * -1: pushing upstream
#
# Caveats
# * pasting / referencing links which are local paths
# * synchronization lag
# * duplication: $__SRC/hg/<pkg> AND $VIRTUAL_ENV/src/<pkg>
#
#   # setup_dotfiles_docs_venv -- create default 'docs' venv
#   # setup_dotfiles_src_venv -- create default 'src' venv
#
#   #   __SRC_HG=${WORKON_HOME}/src/src/hg
#   #   __SRC_GIT=${WORKON_HOME}/src/src/git
#
#   # Hg runs hg commands as user hg
#   # Git runs git commands as user git
#
#   # Hgclone will mirror to $__SRC_HG
#   # Gitclone will mirror to $__SRC_GIT
#
#
# __SRC_GIT_REMOTE_URI_PREFIX  -- default git remote uri prefix
# __SRC_GIT_REMOTE_NAME       -- name for git remote v
# __SRC_HG_REMOTE_URI_PREFIX  -- default hg remote uri prefix
# __SRC_HG_REMOTE_NAME        -- name for hg paths

# $ xrandr-tool outputs
```

2.6 Scripts

<https://github.com/westurner/dotfiles/tree/master/scripts>

In scripts/

bashmarks_to_nerdtree.sh Convert *bashmarks* shortcut variables starting with `DIR_` to NERDTreeBookmarks format:

```
export | grep 'DIR_'
l          # list bashmarks
s awesome  # save PWD as 'awesome' bashmark
```

```
g awesome # goto the 'awesome' bashmark
./bashmarks_to_nerdtree.sh | tee ~/.NERDTreeBookmarks
```

bootstrap_dotfiles.sh Clone, update, and install dotfiles in \$HOME

See: [bootstrap_dotfiles.sh](#)

compare_installed.py Compare packages listed in a debian/ubuntu APT `.manifest` with installed packages.

See: <https://github.com/westurner/pkgsetcomp>

gittagstohgtags.sh Convert `git` tags to `hgtags` format

pulse.sh Setup, configure, start, stop, and restart `pulseaudio`

setup_mathjax.py Setup `MathJax`

setup_pandas_notebook_deb.sh Setup `IPython Notebook`, `Scipy`, `Numpy`, `Pandas` with `Ubuntu` packages and `pip`

setup_pandas_notebook.sh Setup `Brew`, `IPython Notebook`, `scipy`, `numpy`, and `pandas` on `OSX`

setup_scipy_deb.py Install and symlink `scipy`, `numpy`, and `matplotlib` from `apt`

deb_deps.py Work with `debian` dependencies

deb_search.py Search for a `debian` package

build_docs.py Build sets of `sphinx` documentation projects

el Open args from `stdin` with `EDITOR_` or `EDITOR`. Similar to `xargs`.

```
grep -l TODO | el opens files in EDITOR_
```

```
grep -l TODO | el -x echo echos 'filename1 filename2 filename'
```

```
grep -l TODO | el -v --each -x echo runs echo n times, verbosely
```

greppaths.py `Grep`

lsof.py `lsof` subprocess wrapper

mactool.py `MAC` address tool

optimizepath.py Work with `PATH` as an ordered set

passwordstrength.py Gauge password strength

pipls.py Walk and enumerate a `pip` requirements file

pycut.py Similar to `coreutils` `cut`: split line-based files into fields. See: [pyline.py](#) (`pyline 'w[1:2]'`)

py_index.py Create a python package index `HTML` file for a directory of packages. (`.egg`, `.zip`, `.tar.gz`, `tgz`)

pyline.py Similar to `sed` and `awk`: Execute python expressions over line-based files.

See: <https://github.com/westurner/pyline>

pyren.py Skeleton `regex` file rename script

See: <https://github.com/westurner/pyleset>

pyrpo.py Wrap version control system commandline interfaces

See: <https://github.com/westurner/pyrpo>

usrlog.sh **Log shell output** with (by default, unique) `TERM_IDs`, `PWD`, start / finish times to `~/usrlog.log` or `$VIRTUAL_ENV/usrlog.log`.

usrlog.py Search through `.usrlog` files

xlck.sh Wrap `xautolock` for screensaver, shutdown, suspend, resume config (e.g. `.xinitrc` calls `xlck.sh -S`)

x-www-browser Launch browser tabs for each argument (OSX, Linux, webbrowser)

Venv

Venv makes working with *Virtualenv*, *Virtualenvwrapper*, *Bash*, *ZSH*, *Vim*, and *IPython* within a project context very easy.

There are a few parts to venv:

- `ipython_config.py` (`dotfiles.venv.ipython_config`) configures IPython at startup.
- `venv.py` is a symlink to `ipython_config.py`.
- `venv.py` is a CLI script for generating *shell configuration* and *CdAlias* scripts for *Bash*, *ZSH*, *IPython*, and *Vim*.
- `ipython_magics.py` (`dotfiles.venv.ipython_magics`) configures *CdAliases* and the `dotfiles_status` (`ds`) command for *IPython*.
- `10-bashrc.venv.sh` configures *Bash* at startup (see: *Usage > Bash*)

To configure a shell, print relevant env variables (twice), `cd` to the working directory (`$_WRD`), and open `README.rst` in a named *Vim* server for an existing venv named `dotfiles`:

```
we dotfiles; ds; cd wrd; e README.rst
```

Note: For a new venv (as might be created with `mkvirtualenv dotfiles`), the `$_SRC` and `$_WRD` directories do not yet exist. You can create these like so:

```
## _APP=dotfiles _WRD=$VIRTUAL_ENV/src/$_APP
mkdir -p $_WRD
```

Or, to create a more complete *Filesystem Hierarchy Standard* tree of directories under `$VIRTUAL_ENV`:

```
venv_mkdirs; mkdir -p $_WRD
```

3.1 Working With Venv

To work on a venv:

```
we dotfiles
```

`we` is an alias for `workon_venv`, which does `source <(venv.py -q --print-bash --ve=dotfiles).`

Verbosely:

```
__WRK=~/-wrk"                                # cdwrk
PROJECT_HOME="${__WRK}"                       # cdph cdprojecthome
WORKON_HOME="${__WRK}/-ve27"                  # cdwh cdworkonhome
__DOTFILES=~/-dotfiles"                      # cdd cddotfiles
                                              # a very special symlink to
                                              # $WORKON_HOME/dotfiles/src/dotfiles

__VENV=$(which venv.py);
__VENV="${__DOTFILES}/scripts/venv.py"        # 10-bashrc.venv.sh
# venv() { (set -x; $__VENV $@) }             # 10-bashrc.venv.sh
# venv-() { (set -x; $__VENV -e $@) }          # 10-bashrc.venv.sh

# These all print venv.py --help:
$__VENV --help
venv.py --help
venv -h

# Print environment variables for the "dotfiles" venv:
venv.py --print-vars --VIRTUAL_ENV="${WORKON_HOME}/dotfiles"
venv.py --print-vars --virtual-env="${WORKON_HOME}/dotfiles"
venv.py --print-vars --ve="${WORKON_HOME}/dotfiles"
venv.py --print-vars --ve dotfiles
venv.py --print-vars dotfiles

# Generate a source-able Bash configuration script
venv.py --print-bash dotfiles

## Workon the dotfiles virtualenv (in the current shell)
we dotfiles

## Workon the dotfiles virtualenv (with a bash subshell)
venv.py -x bash dotfiles
venv.py -xb dotfiles
```

Note: The following commands are different to argparse (argument order matter with positional arguments)

```
venv dotfiles --print-bash                    # does not work
venv --print-bash dotfiles                    # does work

# As a workaround, be explicit
venv --ve=dotfiles --print-bash              # does work
```

3.1.1 CdAlias

Virtualenv paths can be really long.

CdAliases make it easy to jump around to venv defined variables (like `$_WRK` (cdwrk), `$WORKON_HOME` (cdwh), `VIRTUAL_ENV` (cdv), `$_SRC` (cds), and `$_WRD` (cdw)).

Each `CdAlias` defined in `env.aliases` is expanded for Bash, IPython, and Vim. For example, `CdAlias('$_WRD')` is expanded to `cdwrk`, `cdw`; `%cdwrk`, `cdw`, and `:Cdwrk`, `:Cdw`:

```
# Bash
cdwrk
cdwrk<tab>
cdwrk docs/
```

```
cdw docs/

# IPython
%cdwrld
cdwrld
cdwrld docs/
cdw docs/

# Vim
:Cdwrk
:Cdwrk docs/
:Cdw docs/
```

At build time, the dotfiles Makefile generates the venv CdAlias scripts like so:

```
# Generate venv CdAlias scripts
venv.py --print-bash-cdalias . | tee venv_cdalias.sh
venv.py --print-ipython-cdalias . | tee venv_cdmagic.py
venv.py --print-vim . | tee venv.vim
```

3.1.2 venv.py

```
$ python ../src/dotfiles/venv/ipython_config.py --help
usage: venv [-h] [-V] [-v] [-D] [-T] [-q] [-t] [--platform PLATFORM] [-e]
            [--__WRK [__WRK]] [--__DOTFILES [__DOTFILES]]
            [--WORKON_HOME [WORKON_HOME]] [--VENVSTR [VENVSTR_]]
            [--VENVSTRAPP [VENVSTRAPP_]]
            [--VIRTUAL_ENV_NAME [VIRTUAL_ENV_NAME]]
            [--VENVPREFIX [VENVPREFIX]] [--VIRTUAL_ENV [VIRTUAL_ENV]]
            [--SRC [_SRC]] [--APP [_APP]] [--WRD [_WRD]] [--print-json]
            [--print-json-filename [PRINT_JSON_FILENAME]] [--print-vars]
            [--print-bash] [--print-bash-all] [--print-bash-aliases]
            [--print-bash-cdaliases] [-Z] [--print-vim-cdalias]
            [--print-ipython-magics] [--command RUN_COMMAND] [--run-bash]
            [--run-make] [--run-editp] [--run-terminal] [--pall] [--pwrk]
            [--pworkonhome] [--pvirtualenv] [--psrc] [--pwrld] [--pdotfiles]
            [--prel] [--pkg-resource-path] [--compress]
            [VENVSTR] [VENVSTRAPP] ...
```

venv is a configuration utility for virtual environments.

positional arguments:

VENVSTR	a name of a virtualenv in WORKON_HOME OR a full path to a VIRTUAL_ENV
VENVSTRAPP	a path within _SRC (_WRD=_SRC/VENVSTRAPP)
args	

optional arguments:

-h, --help	show this help message and exit
-V, --version	
-v, --verbose	
-D, --diff, --show-diffs	
-T, --trace	
-q, --quiet	
-t, --test	
--platform PLATFORM	Platform string (default: None)
-e, --from-envron	Build venv.env.envron from keys in os.envron

```

--__WRK [__WRK], --WRK [__WRK], --wrk [__WRK]
    Path to workspace -- ~/wrk
--__DOTFILES [__DOTFILES], --DOTFILES [__DOTFILES], --dotfiles [__DOTFILES]
    Path to ${__DOTFILES} symlink -- ~/dotfiles
--WORKON_HOME [WORKON_HOME], --workonhome [WORKON_HOME], --wh [WORKON_HOME]
    Path to ${WORKON_HOME} directory containing
    VIRTUAL_ENVs
--VENVSTR [VENVSTR_], --venvstr [VENVSTR_], --ve [VENVSTR_]
    Path to VIRTUAL_ENV --
    ${WORKON_HOME}/${VIRTUAL_ENV_NAME} (or a dirname in
    $WORKON_HOME)
--VENVSTRAPP [VENVSTRAPP_], --venvstrapp [VENVSTRAPP_]
    Subpath within {VIRTUAL_ETC}/src/
--VIRTUAL_ENV_NAME [VIRTUAL_ENV_NAME], --virtual-env-name [VIRTUAL_ENV_NAME], --vename [VIRTUAL_ENV_NAME]
    dirname in WORKON_HOME --
    ${WORKON_HOME}/${VIRTUAL_ENV_NAME}
--VENVPREFIX [VENVPREFIX], --venvprefix [VENVPREFIX], --prefix [VENVPREFIX]
    Prefix for _SRC, _ETC, _WRD if [ -z VIRTUAL_ENV ]
--VIRTUAL_ENV [VIRTUAL_ENV], --virtual-env [VIRTUAL_ENV]
    Path to a $VIRTUAL_ENV
--_SRC [_SRC], --SRC [_SRC], --src [_SRC]
    Path to source -- ${VIRTUAL_ENV}/src")
--_APP [_APP], --APP [_APP], --app [_APP]
    Path component string -- ${_SRC}/${_APP}
--_WRD [_WRD], --WRD [_WRD], --wrk [_WRD]
    Path to working directory -- ${_SRC}/${_APP}
--print-json
    Print venv configuration as JSON
--print-json-filename [PRINT_JSON_FILENAME]
    Path to write venv env JSON to
--print-vars, --vars
    Print vars
--print-bash, --bash
    Print Bash shell configuration
--print-bash-all
    Print Bash shell environ and aliases
--print-bash-aliases, --bash-alias
    Print Bash alias script
--print-bash-cdaliases, --bash-cdalias
    Print Bash cdalias script
-Z, --print-zsh
    Print ZSH shell configuration
--print-vim-cdalias, --vim
    Print vimscript configuration
--print-ipython-magics
    Print IPython magic methods
--command RUN_COMMAND, --cmd RUN_COMMAND, -x RUN_COMMAND
    Run a command in a venv-configured shell
--run-bash, --xbash, -xb
    Run bash in the specified venv
--run-make, --xmake, -xmake
    Run (cd $_WRD; make $@) in the specified venv
--run-editp, --open-editors, --edit, -E
    Open $EDITOR with venv.project_files [$PROJECT_FILES]
--run-terminal, --open-terminals, --terminals, --terms
    Open terminals within the venv [gnome-terminal]
--pall, --pathall
    Print possible paths for the given path
--pwrk, --wrk-path
    Print $__WRK/$@
--pworkonhome, --workonhome-path, --pwh
    Print $__WORKON_HOME/$@
--pvirtualenv, --virtualenv-path, --pv
    Print $VIRTUAL_ENV/$@
--psrc, --src-path, --ps

```

```

        Print $_SRC/${@}
--pwr, --wr, --path, --pw
        Print $_WRD/${@}
--pd, --dotfiles, --dotfiles-path, --pd
        Print ${__DOTFILES}/${path}
--prel, --relative-path
        Print ${@}
--pkg-resource-path Path from pkg_resources.TODOTODO
--compress, --compress-paths
        Path $VAR-ify the given paths from stdin

argparse.REMAINDER: If args must be specified, either (VENVSTR AND VENVSTRAPP)
or (--ve [--app]) must be specified first: venv --ve dotfiles -xmake.

```

Python API

A `dotfiles.venv.ipython_config.Venv` object builds:

- a `dotfiles.venv.ipython_config.Env` `OrderedDict` with `$VIRTUAL_ENV`-relative paths and environment variables in a standard filesystem hierarchy
- an `OrderedDict` of command and `CdAlias` aliases

A `dotfiles.venv.ipython_config.Venv` object can then be serialized:

- `--print-vars` – easy to read variables
- `--print-json` – quoted and escaped JSON
- `--print-bash` – quoted and escaped shell script
- `IPython %alias` configuration dict (see `%alias?`)

There are a number of `unittest.TestCase` tests in `dotfiles.venv.ipython_config` (`ipython_config.py`) for each of the build steps.

`venv --verbose --show-diffs` shows what is going on.

3.1.3 Example Venv Configuration

Shell Configuration

`venv.py --print-bash --compress dotfilesx dotfilesx/docs:`

```

$ python ../scripts/venv.py --print-bash --compress dotfilesx dotfilesx/docs \
| sed "s,${HOME},~,g"
export HOME=~"

```

3.2 Other scripts with venv-style paths

To define a script environment just like venv:

```

#!/bin/sh

__WRK="${HOME}/-wrk"                # cdwrk
__DOTFILES="${HOME}/-dotfiles"      # cdd cddotfiles
PROJECT_HOME="${__WRK}"              # cdph cdprojecthome

```

```
WORKON_HOME="${__WRK}/-ve27"                # cdwh cdworkonhome

VIRTUAL_ENV_NAME="dotfiles"                  # 'dotfiles'
__APP=$VIRTUAL_ENV_NAME                      # 'dotfiles[/p/a/t/h]'
VIRTUAL_ENV="$WORKON_HOME/$VIRTUAL_ENV_NAME" # cdv cdvirtualenv
__SRC="${VIRTUAL_ENV}/src"                   # cds cdsrc
__BIN="${VIRTUAL_ENV}/bin"                   # cde cdbin
__ETC="${VIRTUAL_ENV}/etc"                   # cde cdetc
__LOG="${VIRTUAL_ENV}/var/log"                # cd1 cdlog
# ... see: venv.py --print-vars / ...
__WRD="${__SRC}/${__APP}"                    # cdw cdwrld

(set -x; test "$__WRD" == "${HOME}/-wrk/-ve27/dotfiles/src/dotfiles"; \
  || echo "Exception: __WRD = '${__WRD}';" )
```

Docs: <https://westurner.org/tools/>

Src: <https://github.com/westurner/tools>

See Also: <https://westurner.org/wiki/projects#tools>

4.1 Packages

Wikipedia: [https://en.wikipedia.org/wiki/Package_\(package_management_system\)](https://en.wikipedia.org/wiki/Package_(package_management_system))

A software package is an archive of files with a manifest that lists the files included. Often, the manifest contains file checksums and a *signature*.

Many packaging tools make a distinction between source and/or binary packages.

Some packaging tools provide configuration options for:

- Scripts to run when packaging
- Scripts to run at install time
- Scripts to run at uninstal time
- Patches to apply to the “*vanilla*” source tree, as might be obtained from a version control repository

There is a package maintainer whose responsibilities include:

- Testing new *upstream* releases
- *Vetting* changes from release to release
- *Repackaging* upstream releases
- *Signing* new package releases

Packaging lag refers to how long it takes a package maintainer to repackage upstream releases for the target platform(s).

4.1.1 Apt

Wikipedia: https://en.wikipedia.org/wiki/Advanced_Packaging_Tool

Homepage: <https://alioth.debian.org/projects/apt>
Docs: <https://wiki.debian.org/Apt>
Docs: <https://www.debian.org/doc/manuals/debian-reference/ch02.en.html>
Docs: <https://www.debian.org/doc/manuals/apt-howto/>
Docs: <https://wiki.debian.org/SecureApt>
Source: `git git://anonscm.debian.org/git/apt/apt.git`
IRC: `irc://irc.debian.org/debian-apt`

APT (“Advanced Packaging Tool”) is the core of Debian package management.

An APT package repository serves *Dpkg* packages.

An APT package repository can be accessed from a local filesystem or over a network protocol (“apt transports”) like HTTP, HTTPS, RSYNC, FTP, and BitTorrent.

An example of APT usage (e.g. to maintain an updated *Ubuntu Linux* system):

```
apt-get update
apt-get upgrade
apt-get dist-upgrade

apt-cache show bash
apt-get install bash

apt-get --help
man apt-get
man sources.list
```

4.1.2 Bower

Wikipedia: [https://en.wikipedia.org/wiki/Bower_\(software\)](https://en.wikipedia.org/wiki/Bower_(software))
Homepage: <https://www.bower.io/>
Source: <https://github.com/bower/bower>

Bower is “a package manager for the web” (*JavaScript* packages) built on *NPM*.

4.1.3 DEB

Wikipedia: [https://en.wikipedia.org/wiki/Deb_\(file_format\)](https://en.wikipedia.org/wiki/Deb_(file_format))

DEB is the Debian software package format.

DEB packages are built with *Dpkg* and often hosted in an *Apt* package repository.

4.1.4 Dpkg

Wikipedia: <https://en.wikipedia.org/wiki/Dpkg>
Homepage: <https://wiki.debian.org/Teams/Dpkg>
Docs: https://en.wikipedia.org/wiki/Debian_build_toolchain
Docs: https://www.debian.org/doc/manuals/debian-faq/ch-pkg_basics.en.html

Docs: <https://www.debian.org/doc/manuals/debian-faq/ch-pkgtools.en.html>

Docs:

Dpkg is a collection of tools for creating and working with *DEB* packages.

4.1.5 Homebrew

Wikipedia: [https://en.wikipedia.org/wiki/Homebrew_\(package_management_software\)](https://en.wikipedia.org/wiki/Homebrew_(package_management_software))

Homepage: <http://brew.sh/>

Homebrew is a package manager (brew) for *OS X*.

4.1.6 NPM

Wikipedia: [https://en.wikipedia.org/wiki/Npm_\(software\)](https://en.wikipedia.org/wiki/Npm_(software))

Homepage: <https://www.npmjs.org/>

Source: <https://github.com/npm/npm>

NPM is a *JavaScript* package manager created for *Node.js*.

Bower builds on NPM.

4.1.7 NuGet

Wikipedia: <https://en.wikipedia.org/wiki/NuGet>

Homepage: <https://www.nuget.org/>

- Package Repositories (chocolatey):
 - <https://chocolatey.org/>
- Linux/Mac/Windows: No / No / Yes

4.1.8 Portage

Wikipedia: [https://en.wikipedia.org/wiki/Portage_\(software\)](https://en.wikipedia.org/wiki/Portage_(software))

Homepage: <http://wiki.gentoo.org/wiki/Project:Portage>

- Build recipes with flag sets
- Package Repositories (portage)

4.1.9 Ports

Wikipedia: https://en.wikipedia.org/wiki/Ports_collection

Homepage: <https://www.freebsd.org/ports/>

Sources and Makefiles designed to compile software packages for particular distributions' kernel and standard libraries on a particular platform.

4.1.10 RPM

Wikipedia: https://en.wikipedia.org/wiki/RPM_Package_Manager

- Install with `rpm`, `yum`
- Build with tools like `rpmbuild` and `rpm`
- Python: build with `bdist_rpm`, `rpm`
- List contents:

```
less ~/path/to/local.rpm # requires lesspipe to be configured
```

- Package Repositories (`yum`):
 - Local: directories of packages and metadata
 - Network: HTTP, HTTPS, RSYNC, FTP

4.1.11 Python Packages

Homepage: <https://pypi.python.org/pypi>

Docs: <https://packaging.python.org/en/latest/>

Docs: <https://packaging.python.org/en/latest/peps.html>

Docs: <https://packaging.python.org/en/latest/projects.html>

A Python Package is a collection of source code and package data files.

- Python packages have dependencies: they depend on other packages
- Python packages can be served from a package index
- *PyPI* is the community Python Package Index
- A Python package is an archive of files (`.zip` (`.egg`, `.whl`), `.tar`, `.tar.gz`) containing a `setup.py` file containing a version string and metadata that is meant for distribution.
- An source dist (`sdist`) package contains source code (every file listed in or matching a pattern in a `MANIFEST.in` text file).
- A binary dist (`bdist`, `bdist_egg`, `bdist_wheel`) is derived from an `sdist` and may be compiled and named for a specific platform.
- `sdist`s and `bdist`s are defined by a `setup.py` file which contains a call to a `distutils.setup()` or `setuptools.setup()` function.

- The arguments to the `setup.py` function are things like `version`, `author`, `author_email`, and `homepage`; in addition to package dependency strings required for the package to work (`install_requires`), for tests to run (`tests_require`), and for optional things to work (`extras_require`).
- A package dependency string can specify an exact version (`==`) or a greater-than (`>=`) or less-than (`<=`) requirement for each package.
- Package names are looked up from an index server (`--index`), such as *PyPI*, and or an HTML page (`--find-links`) containing URLs containing package names, version strings, and platform strings.
- `easy_install` (*Setuptools*) and *Pip* can install packages from: the local filesystem, a remote index server, or a local index server.
- `easy_install` and `pip` read the `install_requires` (and `extras_require`) attributes of `setup.py` files contained in packages in order to resolve a dependency graph (which can contain cycles) and install necessary packages.

Distutils

Docs: <https://docs.python.org/2/distutils/>

Distutils is a collection of tools for common packaging needs.

Distutils is included in the Python standard library.

Setuptools

Wikipedia: <https://en.wikipedia.org/wiki/Setuptools>

Docs: <https://pythonhosted.org/setuptools/>

Source: hg <https://bitbucket.org/pypa/setuptools>

PyPI: <https://pypi.python.org/pypi/setuptools>

Setuptools is a *Python package* for working with other *Python Packages*.

- Setuptools builds upon *Distutils*
- Setuptools is widely implemented
- Most Python packages are installed by setuptools (by *Pip*)
- Setuptools can be installed by downloading `ez_setup.py` and then running `python ez_setup.py`; or, setuptools can be installed with a system package manager (`apt`, `yum`)
- Setuptools installs a script called `easy_install` which can be used to install packages from the local filesystem, a remote index server, a local index server, or an HTML page
- `easy_install` `pip` installs *Pip* from PyPI
- Like `easy_install`, *Pip* installs python packages, with a number of additional configuration options
- Setuptools can build *RPM* and *DEB* packages from python packages, with some extra configuration:

```
python setup.py bdist_rpm --help
python setup.py --command-packages=stdeb.command bdist_deb --help
```

Pip

Wikipedia: [https://en.wikipedia.org/wiki/Pip_\(package_manager\)](https://en.wikipedia.org/wiki/Pip_(package_manager))

Homepage: <https://pip.pypa.io/>

Docs: https://pip.pypa.io/en/latest/user_guide.html

Docs: <https://pip.readthedocs.org/en/latest/>

Source: git <https://github.com/pypa/pip>

Pypi: <https://pypi.python.org/pypi/pip>

IRC: #pypa

IRC: #pypa-dev

Pip is a tool for installing, upgrading, and uninstalling *Python* packages.

```
pip help
pip help install
pip --version

sudo apt-get install python-pip
pip install --upgrade pip

pip install libcloud
pip install -r requirements.txt
pip uninstall libcloud
```

- Pip stands upon *Distutils* and *Setuptools*.
- Pip retrieves, installs, upgrades, and uninstalls packages.
- Pip can list installed packages with `pip freeze` (and `pip list`).
- Pip can install packages as ‘editable’ packages (`pip install -e`) from version control repository URLs which must begin with `vcs+`, end with `#egg=<usuallythepackagename>`, and may contain an `@vcstag` tag (such as a branch name or a version tag).
- Pip installs packages as editable by first cloning (or checking out) the code to `./src` (or `${VIRTUAL_ENV}/src` if working in a *Virtualenv*) and then running `setup.py develop`.
- Pip configuration is in `${HOME}/.pip/pip.conf`.
- Pip can maintain a local cache of downloaded packages, which can lessen the load on package servers during testing.
- Pip skips reinstallation if a package requirement is already satisfied.
- Pip requires the `--upgrade` and/or `--force-reinstall` options to be added to the `pip install` command in order to upgrade or reinstall.
- At the time of this writing, the latest stable pip version is 1.5.6.

Warning: With *Python* 2, pip is preferable to *Setuptools*’s `easy_install` because pip installs `backports.ssl_match_hostname` in order to validate HTTPS certificates (by making sure that the certificate hostname matches the hostname from which the DNS resolved to).

Cloning packages from source repositories over `ssh://` or `https://`, either manually or with `pip install -e` avoids this concern.

There is also a tool called *Peep* which requires considered-good SHA256 checksums to be specified for every dependency listed in a `requirements.txt` file.

For more information, see: <http://legacy.python.org/dev/peps/pep-0476/#python-versions>

Pip Requirements File Plaintext list of packages and package URIs to install.

Requirements files may contain version specifiers (pip >= 1.5)

Pip installs Pip Requirement Files:

```
pip install -r requirements.txt
pip install --upgrade -r requirements.txt
pip install --upgrade --user --force-reinstall -r requirements.txt
```

An example requirements.txt file:

```
# install pip from the default index (PyPI)
pip
--index=https://pypi.python.org/simple --upgrade pip

# Install pip 1.5 or greater from PyPI
pip >= 1.5

# Git clone and install pip as an editable develop egg
-e git+https://github.com/pypa/pip@1.5.X#egg=pip

# Install a source distribution release from PyPI
# and check the MD5 checksum in the URL
https://pypi.python.org/packages/source/p/pip/pip-1.5.5.tar.gz#md5=7520581ba0687dec1ce85bd154965

# Install a source distribution release from Warehouse
https://warehouse.python.org/packages/source/p/pip/pip-1.5.5.tar.gz

# Install an additional requirements.txt file
-r requirements/more-requirements.txt
```

Peep

Source: <https://github.com/erikrose/peep>

PyPI: <https://pypi.python.org/pypi/peep>

Peep works just like *Pip*, but requires SHA256 checksum hashes to be specified for each package in requirements.txt file.

PyPI

Wikipedia: https://en.wikipedia.org/wiki/Python_Package_Index

Docs: <https://wiki.python.org/moin/CheeseShop>

Docs: <https://wiki.python.org/moin/CheeseShopDev>

Homepage: <https://pypi.python.org/pypi>

Source: <https://bitbucket.org/pypa/pypi>

PyPI is the Python Package Index.

Warehouse

Homepage: <https://warehouse.python.org/>

Docs: <https://warehouse.readthedocs.org/en/latest/>

Source: <https://github.com/pypa/warehouse>

Warehouse is the “Next Generation Python Package Repository”.

All packages uploaded to *PyPI* are also available from Warehouse.

Wheel

Docs: <http://legacy.python.org/dev/peps/pep-0427/>

Docs: <http://wheel.readthedocs.org/en/latest/>

Source: hg <https://bitbucket.org/pypa/wheel/>

PyPI: <https://pypi.python.org/pypi/wheel>

- Wheel is a newer, PEP-based standard (`.whl`) with a different metadata format, the ability to specify (JSON) digital signatures for a package within the package, and a number of additional speed and platform-consistency advantages.
- Wheels can be uploaded to PyPI.
- Wheels are generally faster than traditional Python packages.

Packages available as wheels are listed at <http://pythonwheels.com/>.

Conda

Docs: <http://conda.pydata.org/docs/>

Source: git <https://github.com/conda/conda>

PyPI: <https://pypi.python.org/pypi/conda>

- Conda installs packages written in any language; especially Python
- `conda skeleton` can automatically create conda packages both from PyPI and from CPAN (Perl)
- Conda was originally created for the Anaconda Python Distribution, which installs packages written in *Python*, *R*, *JavaScript*, *Ruby*, *C*, *Fortran*
- Conda (and *Anaconda*) packages are hosted by <https://binstar.org>, which hosts free public and paid private Conda packages.
 - Anaconda Server is an internal “Private, Secure Package Repository” that “supports over 100 different repositories, including PyPI, CRAN, conda, and the Anaconda repository.”

To create a fresh conda env:

```
# Python 2.7
conda env create -n exmpl2 --yes python readline pip
# conda install ipython-notebook

# Python 3.X
conda env create -n exmpl3 --yes python3 readline pip
```

Work on a conda env:

```
source activate exmpl2
conda list
source deactivate
```

4.1.12 RubyGems

Wikipedia: <https://en.wikipedia.org/wiki/RubyGems>

Homepage: <https://rubygems.org/>

Docs: <http://guides.rubygems.org/>

Source: <https://github.com/rubygems/rubygems>

- RubyGems installs Ruby Gems

4.1.13 Yum

Wikipedia: https://en.wikipedia.org/wiki/Yellowdog_Updater,_Modified

Homepage: <http://yum.baseurl.org/>

Yum is a tool for installing, upgrading, and uninstalling *RPM* packages.

4.2 Version Control Systems

Wikipedia: https://en.wikipedia.org/wiki/Revision_control

Wikipedia: https://en.wikipedia.org/wiki/Distributed_revision_control

Version Control Systems (VCS) — or Revision Control Systems (RCS) — are designed to solve various problems in change management.

- VCS store code in a **repository**.
- Changes to one or more files are called **changesets**, **commits**, or **revisions**
- Changesets are **comitted** or **checked into** to a repository.
- Changesets are **checked out** from a repository
- Many/most VCS differentiate between the repository and a **working directory**, which is currently **checked out** to a specific *changeset* identified by a **revision identifier**; possibly with **uncommitted** local changes.
- A **branch** is forked from a line of development and then **merged** back in.
- Most projects designate a *main line* of development referred to as a **trunk**, **master**, or **default** branch.
- Many projects work with *feature* and *release* branches, which, ideally, eventually converge by being merged back into **trunk**. (see: *HubFlow* for an excellent example of branching)
- Traditional VCS are centralized on a single point-of-failure.
- Some VCS have a concept of *locking* to prevent multiple peoples' changes from *colliding*
- Distributed Version Control Systems (DVCS) (can) **clone** all **revisions** of every **branch** of a repository every time. *

- DVCS changesets are **pushed** to a different repository
- DVCS changesets are **pulled** from another repository into a *local clone* or **copy** of a repository
- Teams working with DVCS often designate a central repository hosted by a project forge service like SourceForge, GNU Savannah, GitHub, or BitBucket.
- Contributors send **patches** which build upon a specific revision, which can be applied by a maintainer with **commit access** permissions.
- Contributors **fork** a new **branch** from a specific revision, commit changes, and then send a **pull request**, which can be applied by a maintainer with **commit access** permissions.

4.2.1 CVS

Homepage: <http://www.nongnu.org/cvs/>

Homepage: <http://savannah.nongnu.org/projects/cvs>

Wikipedia: https://en.wikipedia.org/wiki/Concurrent_Versions_System

Docs: <http://www.nongnu.org/cvs/#documentation>

CVS (`cvs`) is a centralized version control system (VCS) written in *C*.

CVS predates most/many other VCS.

4.2.2 Subversion

Homepage: <https://subversion.apache.org/>

Wikipedia: https://en.wikipedia.org/wiki/Apache_Subversion

Docs: <https://subversion.apache.org/docs/>

Docs: <https://subversion.apache.org/quick-start>

Source: `svn` <http://svn.apache.org/repos/asf/subversion/trunk>

Apache Subversion (`svn`) is a centralized revision control system (VCS) written in *C*.

To checkout a revision of a repository with `svn`:

```
svn co http://svn.apache.org/repos/asf/subversion/trunk subversion
```

4.2.3 Bazaar

Wikipedia: https://en.wikipedia.org/wiki/GNU_Bazaar

Homepage: <http://bazaar.canonical.com/en/>

Homepage: <https://launchpad.net/bzr>

Docs: <http://doc.bazaar.canonical.com/en/>

Docs: <http://doc.bazaar.canonical.com/latest/en/mini-tutorial/index.html>

Source: `bzr` `lp:bzr`

GNU Bazaar (`bzr`) is a distributed revision control system (DVCS, RCS, VCS) written in *Python* and *C*.

<http://launchpad.net> hosts Bazaar repositories; with special support from the `bzr` tool in the form of `lp:` urls like `lp:bzr`.

To clone a repository with `bzr`:

```
bzr branch lp:bzr
```

4.2.4 Git

Wikipedia: [https://en.wikipedia.org/wiki/Git_\(software\)](https://en.wikipedia.org/wiki/Git_(software))

Homepage: <http://git-scm.com/>

Docs: <http://git-scm.com/documentation>

Docs: <http://git-scm.com/book/en/>

Docs: <http://documentup.com/skwp/git-workflows-book>

Docs: <http://learnxinyminutes.com/docs/git/>

Source: `git` <https://github.com/git/git>

Git (`git`) is a distributed version control system for tracking a branching and merging repository of file revisions written in `C` (DVCS, VCS, RCS).

To clone a repository with `git`:

```
git clone https://github.com/git/git
```

HubFlow

Src: <https://github.com/datasift/gitflow>

Docs: <https://datasift.github.io/gitflow/>

Docs: <https://datasift.github.io/gitflow/IntroducingGitFlow.html>

Docs: <https://datasift.github.io/gitflow/TheHubFlowTools.html>

HubFlow is a fork of GitFlow that adds extremely useful commands for working with Git and GitHub.

HubFlow is a named branch workflow with mostly-automated merges between branches.

Branch names are configurable; the defaults are as follows:

Branch Name	Description (and Code Labels)
<code>master</code>	Stable trunk (latest release)
<code>develop</code>	Development main line
<code>feature/<name></code>	New features for the next release (e.g. ENH, PRF)
<code>hotfix/<name></code>	Fixes to merge to both <code>master</code> and <code>develop</code> (e.g. BUG, TST, DOC)
<code>release/<name></code>	In-progress release branches (e.g. RLS)

Creating a new release with `Git` and HubFlow:

```
git clone ssh://git@github.com:westurner/dotfiles
# git checkout master
git hf init
## Update versiontag in .git/config to prefix release tags with 'v'
# [hubflow "prefix"]
# feature = feature/
# release = release/
```

```
# hotfix = hotfix/  
# support = support/  
# versiontag = v  
#  
git hf feature start print_hello_world  
## commit, commit, commit  
git hf feature finish print_hello_world  
git hf release start 0.1.0  
## commit (e.g. update version in setup.py, release notes)  
git hf release finish 0.1.0
```

The GitFlow HubFlow illustrations are very helpful for visualizing and understanding any DVCS workflow: <https://datasift.github.io/gitflow/IntroducingGitFlow.html>.

4.2.5 Mercurial

Wikipedia: <https://en.wikipedia.org/wiki/Mercurial>

Homepage: <http://hg.selenic.org/>

Docs: <http://mercurial.selenic.com/guide>

Docs: <http://hgbook.red-bean.com/>

Source: hg <http://selenic.com/hg>

Source: hg <http://hg.intevation.org/mercurial/crew>

Mercurial (hg) is a distributed revision control system written in *Python* and *C* (DVCS, VCS, RCS).

To clone a repository with hg:

```
hg clone http://selenic.com/hg
```

4.3 Anaconda

Wikipedia: [https://en.wikipedia.org/wiki/Anaconda_\(Python_distribution\)](https://en.wikipedia.org/wiki/Anaconda_(Python_distribution))

Homepage: <https://store.continuum.io/cshop/anaconda/>

Docs: <http://docs.continuum.io/anaconda/>

Docs: <http://docs.continuum.io/anaconda/pkg-docs.html>

Anaconda is a maintained distribution of many popular *Python Packages*.

Anaconda works with *Conda* packages.

Note: [https://en.wikipedia.org/wiki/Anaconda_\(installer\)](https://en.wikipedia.org/wiki/Anaconda_(installer)) (1999) is the installer for *RPM*-based *Linux* distributions; which is also written in *Python* (and *C*).

4.4 Awk

Wikipedia: <https://en.wikipedia.org/wiki/AWK>

Docs: https://en.wikipedia.org/wiki/AWK#Versions_and_implementations

GNU Awk

Project: <https://savannah.gnu.org/projects/gawk/>

Homepage: <https://www.gnu.org/software/gawk/>

Docs: <https://www.gnu.org/software/gawk/manual/>

Docs: <https://www.gnu.org/software/gawk/manual/gawk.html>

Source: `git git://git.savannah.gnu.org/gawk.git`

AWK is a pattern programming language for matching and transforming text.

4.5 Bash

Wikipedia: [https://en.wikipedia.org/wiki/Bash_\(Unix_shell\)](https://en.wikipedia.org/wiki/Bash_(Unix_shell))

Homepage: <http://www.gnu.org/software/bash/>

Docs: <https://www.gnu.org/software/bash/manual/>

Source: `git git://git.savannah.gnu.org/bash.git`

Bash, the Bourne-again shell.

```
type bash
bash --help
help help
help type
apropos bash
info bash
man bash
```

- Designed to work with unix command outputs and return codes
- Functions
- Portability: sh (sh, bash, dash, zsh) shell scripts are mostly compatible
- Logging:

```
set -x # print commands and arguments
set -v # print source
```

Bash Configuration:

```
/etc/profile
/etc/bash.bashrc
/etc/profile.d/*.sh
${HOME}/.profile      /etc/skel/.profile  # PATH+=${HOME}/bin  # umask
${HOME}/.bash_profile  # empty. preempts .profile
```

Linux/Mac/Windows: Almost Always / Bash 3.2 / Cygwin/Mingwin

4.6 Binutils

Wikipedia: https://en.wikipedia.org/wiki/GNU_Binutils

Homepage: <https://www.gnu.org/software/binutils/>

Src: [git://sourceware.org/git/binutils-gdb.git](https://sourceware.org/git/binutils-gdb.git)
Docs: <https://sourceware.org/binutils/docs-2.24/>
Docs: <https://sourceware.org/binutils/docs-2.24/binutils/index.html>
Docs: <https://sourceware.org/binutils/docs-2.24/as/index.html>
Docs: <https://sourceware.org/binutils/docs-2.24/ld/index.html>

GNU Binutils are a set of utilities for working with assembly and binary.

GCC utilizes GNU Binutils to compile the GNU/*Linux* kernel and userspace.

GAS, the GNU Assembler (*as*) assembles ASM code for linking by the GNU linker (*ld*).

4.7 C

Wikipedia: [https://en.wikipedia.org/wiki/C_\(programming_language\)](https://en.wikipedia.org/wiki/C_(programming_language))

Docs: <http://learnxinyminutes.com/docs/c/>

C is a third-generation programming language which affords relatively low-level machine access while providing helpful abstractions.

The GNU/*Linux* kernel is written in C and often compiled by *GCC* or *Clang* for a particular architecture (see: `man uname`)

Libc libraries are written in C.

Almost all of the projects linked here, at some point, utilize code written in C.

4.8 C++

Wikipedia: <https://en.wikipedia.org/wiki/C++>

Docs: <http://learnxinyminutes.com/docs/c++/>

C++ is a third-generation programming language which adds object orientation and a standard library to C.

- C++ is an ISO specification: C++98, C++03, C++11 (C++0x), C++14, [C++17]

4.9 Clang

Wikipedia: <https://en.wikipedia.org/wiki/Clang>

Homepage: <http://clang.llvm.org/>

Docs: <http://clang.llvm.org/docs/>

Docs: <http://clang.llvm.org/docs/UsersManual.html>

Clang is a compiler front end for C, C++, and Objective C++.

4.10 Compiz

Wikipedia: <https://en.wikipedia.org/wiki/Compiz>

Homepage: <https://launchpad.net/compiz>

Docs: <http://wiki.compiz.org/>

Source: bazaar branch lp:compiz

Compiz is a window compositing layer for *X11* which adds lots of cool and productivity-enhancing visual capabilities.

4.11 CoreOS

Wikipedia: <https://en.wikipedia.org/wiki/CoreOS>

Homepage: <https://coreos.com/>

Docs: <https://coreos.com/docs/>

Source: <https://github.com/coreos>

CoreOS is a *Linux* distribution for highly available distributed computing.

CoreOS schedules redundant *Docker* images with **fleet** and **systemd** according to configuration stored in **etcd**, a key-value store with a D-Bus interface.

4.12 Docker

Wikipedia: [https://en.wikipedia.org/wiki/Docker_\(software\)](https://en.wikipedia.org/wiki/Docker_(software))

Homepage: <https://www.docker.com/>

Docs: <https://docs.docker.com/>

Source: <https://github.com/docker/docker>

Docker is an OS virtualization project which utilizes Linux LXC Containers to partition process workloads all running under one kernel.

Limitations

- Writing to */etc/hosts*: <https://github.com/docker/docker/issues/2267>
- Apt-get upgrade: <https://github.com/docker/docker/issues/3934>

4.13 Docutils

Homepage: <http://docutils.sourceforge.net>

Docs: <http://docutils.sourceforge.net/docs/>

Docs: <http://docutils.sourceforge.net/rst.html>

Docs: <http://docutils.sourceforge.net/docs/ref/doctree.html>

Source: svn <http://svn.code.sf.net/p/docutils/code/trunk>

Docutils is a text processing system which ‘parses’ *ReStructuredText* lightweight markup language into a doctree which it serializes into HTML, LaTeX, man-pages, Open Document files, XML, and a number of other formats.

4.14 Fortran

Wikipedia: <https://en.wikipedia.org/wiki/Fortran>

Fortran (or FORTRAN) is a third-generation programming language frequently used for mathematical and scientific computing.

4.15 Filesystem Hierarchy Standard

Wikipedia: https://en.wikipedia.org/wiki/Filesystem_Hierarchy_Standard

Website: <http://www.linuxfoundation.org/collaborate/workgroups/lsb/fhs>

The Filesystem Hierarchy Standard is a well-worn industry-supported system file naming structure.

Ubuntu and *Virtualenv* implement a Filesystem Hierarchy.

Docker layers filesystem hierarchies with aufs and now also btrfs subvolumes.

4.16 GCC

Wikipedia: https://en.wikipedia.org/wiki/GNU_Compiler_Collection

Homepage: <https://gcc.gnu.org/>

Docs: <https://gcc.gnu.org/onlinedocs/>

Source: git ssh://gcc.gnu.org/git/gcc.git

The GNU Compiler Collection started as a Free and Open Source compiler for *C*.

There are now GCC frontends for many languages, including *C++*, *Fortran*, *Java*, and *Go*.

4.17 Gnome

Wikipedia: <https://en.wikipedia.org/wiki/GNOME>

Homepage: <http://www.gnome.org/>

Docs: <https://help.gnome.org/>

Source: <https://git.gnome.org/browse/>

- <https://wiki.gnome.org/GnomeLove>

4.18 Go

Wikipedia: [https://en.wikipedia.org/wiki/Go_\(programming_language\)](https://en.wikipedia.org/wiki/Go_(programming_language))

Homepage: <http://golang.org/>

Docs: <http://golang.org/doc/>

Source: hg <https://code.google.com/p/go/>

Go is a statically-typed *C*-based third generation language.

4.19 Grep

Wikipedia: <https://en.wikipedia.org/wiki/Grep>

Homepage: <https://www.gnu.org/software/grep/>

Project: <https://savannah.gnu.org/projects/grep/>

Docs: <https://www.gnu.org/software/grep/manual/>

Docs: <https://www.gnu.org/software/grep/manual/grep.html>

Source: git [git://git.savannah.gnu.org/grep.git](https://git.savannah.gnu.org/grep.git)

Grep is a UNIX CLI utility for pattern-based text matching.

4.20 Htop

Wikipedia: <https://en.wikipedia.org/wiki/Htop>

Homepage: <http://hisham.hm/htop/>

Source: git <http://hisham.hm/htop/>

4.21 I3wm

Wikipedia: [https://en.wikipedia.org/wiki/I3_\(window_manager\)](https://en.wikipedia.org/wiki/I3_(window_manager))

Homepage: <http://i3wm.org/>

Docs: <http://i3wm.org/docs/>

Source: git [git://code.i3wm.org/i3](https://code.i3wm.org/i3)

I3wm is a tiling window manager for *X11 (Linux)* with extremely-configurable *Vim*-like keyboard shortcuts.

- <http://i3wm.org/downloads/>

4.22 IPython

Wikipedia: <https://en.wikipedia.org/wiki/IPython>

Homepage: <http://ipython.org/>

Docs: <http://ipython.org/ipython-doc/stable/>

Docs: <https://github.com/ipython/ipython/wiki/Extensions-Index>

Docs: <https://github.com/ipython/ipython/wiki/A-gallery-of-interesting-IPython-Notebooks>

Source: git <https://github.com/ipython/ipython>

IPython is an interactive REPL and distributed computation framework written in *Python*.

An IPython notebook file (`.ipynb`) is a JSON document containing input and output for a linear sequence of cells; which can be exported to many output formats (e.g. HTML, RST, LaTeX, PDF); and edited through the web with IPython Notebook.

```
1 + 1
x = 1+1
print("1 + 1 = %d" (x))

# IPython
?                                # help
%lsmagic                         # list magic commands and aliases
%<tab>                           # help for the %logstart magic command
%logstart?                       # help for the %logstart magic command
%logstart -o logoutput.log.py    # log input and output to a file
import json
json?                            # print(json.__doc__)
json??                          # print(inspect.getsource(json))

# IPython shell
!cat ./README.rst; echo $PWD     # run shell commands
lines = !ls -al                 # capture shell command output
print(lines[0:])
%run -i -t example.py           # run a script with timing info,
                                # in the local namespace
%run -d example.py              # run a script with pdb
%pdb on                         # automatically run pdb on Exception
```

Note: IPython notebook runs code and shell commands as the user the process is running as, on a remote or local machine.

IPython notebook supports more than 20 different languages.

Reproducible *SciPy Stack* IPython / Jupyter Notebook servers implement best practices like process isolation and privilege separation:

- <https://registry.hub.docker.com/repos/ipython/>
- <https://registry.hub.docker.com/repos/jupyter/>
- <https://registry.hub.docker.com/u/jupyter/tmponb/>

IPython / Jupyter Notebook Viewer (`nbviewer`) is an application for serving read-only versions of notebooks which have HTTP URLs.

- <http://nbviewer.ipython.org>
- <https://github.com/jupyter/nbviewer>

4.23 Java

Wikipedia: [https://en.wikipedia.org/wiki/Java_\(programming_language\)](https://en.wikipedia.org/wiki/Java_(programming_language))

Docs: <http://javadocs.org/>

Docs: <http://learnxinyminutes.com/docs/java/>

Java is a third-generation programming language which is compiled into code that runs in a virtual machine (JVM) written in *C* for many different operating systems.

4.24 JavaScript

Wikipedia: <https://en.wikipedia.org/wiki/JavaScript>

Docs: <https://en.wikipedia.org/wiki/ECMAScript>

Docs: <http://learnxinyminutes.com/docs/javascript/>

JavaScript is a third-generation programming language designed to run in an interpreter; now specified as *ECMAScript*.

All major web browsers support Javascript.

Client-side (web) applications can be written in Javascript.

Server-side (web) applications can be written in Javascript, often with *Node.js* and *NPM* packages.

Note: Java and JavaScript are two distinctly different languages and developer ecosystems.

4.25 Jinja2

Wikipedia: https://en.wikipedia.org/wiki/Jinja_%28template_engine%29

Homepage: <http://jinja.pocoo.org/>

Source: <https://github.com/mitsuhiko/jinja2>

Docs: <https://jinja2.readthedocs.org/en/latest/>

Docs: <http://jinja.pocoo.org/docs/dev/>

Jinja (jinja2) is a templating engine written in *Python*.

Sphinx and *Salt* are two projects that utilize Jinja2.

4.26 JSON

Wikipedia: <https://en.wikipedia.org/wiki/JSON>

Homepage: <http://json.org/>

Docs: <http://learnxinyminutes.com/docs/json/>

JSON is an object representation in *JavaScript* syntax which is now supported by libraries for many language.

A list of objects with key and value attributes in JSON syntax:

```
[
{ "key": "language", "value": "Javascript" },
{ "key": "version", "value": 1 },
{ "key": "example", "value": true },
]
```

Machine-generated JSON is often not very readable, because it doesn't contain extra spaces or newlines. The *Python* JSON library contains a utility for parsing and indenting ("prettifying") JSON from the commandline

```
cat example.json | python -m json.tool
```

4.26.1 JSON-LD

Wikipedia: <https://en.wikipedia.org/wiki/JSON-LD>

Homepage: <http://json-ld.org>

Docs: <http://json-ld.org/playground/>

JSON-LD is a web standard for Linked Data in *JSON*.

An example from the JSON-LD Playground (<http://goo.gl/xxZ410>):

```
{
  "@context": {

4.27 KDE

Wikipedia: <https://en.wikipedia.org/wiki/KDE>

Homepage: <https://www.kde.org/>

Docs: <https://docs.kde.org/>

Docs: <https://www.kde.org/documentation/>

Source: https://techbase.kde.org/Getting_Started/Sources

Source: https://techbase.kde.org/Getting_Started/Sources/Subversion

Source: <https://techbase.kde.org/Development/Git>

Source: <https://projects.kde.org/projects>

KDE is a GUI framework built on Qt.

KWin is the main KDE window manager for *X11*.

4.28 Libc

Wikipedia: https://en.wikipedia.org/wiki/C_POSIX_library

A libc is a standard library of *C* routines.

Libc implementations:

- *Glibc*
- https://en.wikipedia.org/wiki/C_standard_library#BSD_libc
- <https://en.wikipedia.org/wiki/UCLibc>
- [https://en.wikipedia.org/wiki/Bionic_\(software\)](https://en.wikipedia.org/wiki/Bionic_(software))

4.28.1 Glibc

Wikipedia: https://en.wikipedia.org/wiki/GNU_C_Library

Homepage: <https://www.gnu.org/software/libc/>

Docs: <https://www.gnu.org/software/libc/documentation.html>

Docs: https://www.gnu.org/software/libc/manual/html_mono/libc.html

Docs: <http://sourceware.org/glibc/wiki/HomePage>

Source: https://en.wikipedia.org/wiki/GNU_C_Library

Glibc is the GNU *C* Library (*Libc*).

Many *Linux* packages and the *GNU/Linux* kernel build from Glibc.

4.29 Libcloud

Homepage: <https://libcloud.apache.org/>

Docs: <https://libcloud.readthedocs.org/en/latest/>

Docs: https://libcloud.readthedocs.org/en/latest/supported_providers.html

Source: git [git://git.apache.org/libcloud.git](https://git.apache.org/libcloud.git)

Source: git <https://github.com/apache/libcloud>

Apache libcloud is a *Python* library which abstracts and unifies a large number of Cloud APIs for Compute Resources, Object Storage, Load Balancing, and DNS.

Salt salt cloud depends upon libcloud.

4.30 Libvirt

Wikipedia: <https://libvirt.org/>

Homepage: <https://libvirt.org/>

Docs: <https://libvirt.org/docs.html>

Docs: <https://docs.saltstack.com/en/latest/ref/modules/all/salt.modules.virt.html>

Source: git git://libvirt.org/libvirt-appdev-guide.git

Libvirt is a system for platform virtualization with various *Linux* hypervisors.

- KVM/QEMU
- Xen
- LXC
- OpenVZ
- VirtualBox

4.31 Linux

Wikipedia: <https://en.wikipedia.org/wiki/Linux>

Homepage: <https://www.kernel.org/>

Docs: <https://www.kernel.org/doc/>

Source: git <https://github.com/torvalds/linux>

GNU/Linux is a free and open source operating system kernel written in *C*.

```
uname -a; echo "Linux"
uname -o; echo "GNU/Linux"
```

A *Linux Distribution* is a collection of *Packages* compiled to work with a GNU/Linux kernel and a *Libc*.

4.32 LLVM

Wikipedia: <https://en.wikipedia.org/wiki/LLVM>

Homepage: <http://llvm.org/>

Source: git <http://llvm.org/git/llvm.git>

Docs: <http://llvm.org/docs/>

Docs: <http://llvm.org/docs/GettingStarted.html>

Docs: <http://llvm.org/docs/ReleaseNotes.html>

Docs: <http://llvm.org/ProjectsWithLLVM/>

LLVM “*Low Level Virtual Machine*” is a reusable compiler infrastructure with frontends for many languages.

- *Clang*
- *PyPy*

4.33 Make

Wikipedia: [https://en.wikipedia.org/wiki/Make_\(software\)](https://en.wikipedia.org/wiki/Make_(software))

Homepage: <https://www.gnu.org/software/make/>

Project: <https://savannah.gnu.org/projects/make/>

Docs: <https://www.gnu.org/software/make/manual/make.html>

Source: git <git://git.savannah.gnu.org/make.git>

GNU Make is a classic, ubiquitous software build tool designed for file-based source code compilation.

Bash, *Python*, and the GNU/*Linux* kernel are all built with Make.

Make build task chains are represented in a `Makefile`.

Pros

- Simple, easy to read syntax
- Designed to build files on disk
- Nesting: `make -C <path> <taskname>`
- Variable Syntax: `$(VARIABLE_NAME)`
- Bash completion: `make <tab>`
- Python: Parseable with `disutils.text_file` Text File
- Logging: command names and values to stdout

Cons

- Platform Portability: `make` is not installed everywhere
- Global Variables: Parametrization with shell scripts

4.34 MessagePack

Wikipedia: <https://en.wikipedia.org/wiki/MessagePack>

Homepage: <http://msgpack.org/>

MessagePack is a data interchange format with implementations in many languages.

Salt

4.35 Node.js

Wikipedia: <https://en.wikipedia.org/wiki/Node.js>

Homepage: <http://www.nodejs.org>

Source: <https://github.com/joyent/node>

Node.js is a framework for *JavaScript* applications written in *C*, *C++*, and *JavaScript*.

4.36 OS X

Wikipedia: https://en.wikipedia.org/wiki/OS_X

Homepage: <http://www.apple.com/osx>

Docs: <https://developer.apple.com/technologies/mac/>

Docs: <https://developer.apple.com/library/mac/navigation/>

Docs: <https://developer.apple.com/library/mac/documentation/Darwin/Reference/ManPages/>

Source: <https://www.apple.com/opensource/>

OS X is a UNIX operating system based upon the Mach kernel from NeXTSTEP, which was partially derived from NetBSD and FreeBSD.

OS X GUI support is built from XFree86/X.org *X11*.

OS X maintains forks of many POSIX BSD and GNU tools like `bash`, `readlink`, and `find`.

Homebrew installs and maintains packages for OS X.

```
uname; echo "Darwin"
```

4.37 Packer

Homepage: <https://www.packer.io/>

Docs: <http://www.packer.io/docs>

Docs: <http://www.packer.io/docs/basics/terminology.html>

Source: git <https://github.com/mitchellh/packer>

Packer generates machine images for multiple platforms, clouds, and hypervisors from a parameterizable template.

Packer Artifact Build products: machine image and manifest

Packer Template JSON build definitions with optional variables and templating

Packer Build Task defined by a JSON file containing build steps which produce a machine image

Packer Builder Packer components which produce machine images for one of many platforms:

- VirtualBox
- Docker
- OpenStack
- GCE
- EC2
- VMware
- QEMU (KVM, Xen)
- <http://www.packer.io/docs/templates/builders.html>

Packer Provisioner Packer components for provisioning machine images at build time

- Shell scripts
- File uploads
- ansible
- chef
- solo
- puppet
- salt

Packer Post-Processor Packer components for compressing and uploading built machine images

4.38 Perl

Wikipedia: <https://en.wikipedia.org/wiki/Perl>

Homepage: <http://www.perl.org/>

Project: <http://dev.perl.org/perl5/>

Docs: <http://www.perl.org/docs.html>

Source: `git git://perl5.git.perl.org/perl.git`

Perl is a dynamically typed, *C*-based third-generation programming language.

Many of the Debian system management tools are or were originally written in Perl.

4.39 Python

Wikipedia: [https://en.wikipedia.org/wiki/Python_\(programming_language\)](https://en.wikipedia.org/wiki/Python_(programming_language))

Homepage: <https://www.python.org/>

Docs: <https://docs.python.org/2/>

Docs: <https://docs.python.org/devguide/>

Docs: <https://docs.python.org/devguide/documenting.html>

Docs: <http://learnxinyminutes.com/docs/python/>

Source: hg <https://hg.python.org/cpython>

Python is a dynamically-typed, *C*-based third-generation programming language.

As a multi-paradigm language with support for functional and object-oriented code, Python is often utilized for system administration and scientific software development.

Many of the RedHat system management tools (such as *Yum*) are written in Python. Gentoo *Portage* is written in Python.

IPython, *Pip*, *Conda*, *Sphinx*, *Docutils*, *Mercurial*, *Libcloud*, *Salt*, *Tox*, *Virtualenv*, and *Virtualenvwrapper* are all written in Python.

The Python community is generously supported by a number of sponsors and the Python Infrastructure Team:

- <https://www.python.org/psf/sponsorship/>
- <https://www.python.org/psf/members/#sponsor-members>
- <http://psf-salt.readthedocs.org/en/latest/overview/>

4.39.1 CPython

Wikipedia: [https://en.wikipedia.org/wiki/Python_\(programming_language\)](https://en.wikipedia.org/wiki/Python_(programming_language))

Homepage: <https://www.python.org/>

Docs: <https://docs.python.org/2/>

Docs: <https://docs.python.org/devguide/>

Docs: <https://docs.python.org/devguide/documenting.html>

Docs: <http://learnxinyminutes.com/docs/python/>

Source: hg <https://hg.python.org/cpython>

CPython is the reference *Python* language implementation written in *C*.

- <https://github.com/python/cpython/blob/master/Grammar/Grammar>

CPython can interface with other *C* libraries through a number of interfaces:

- <https://docs.python.org/2/c-api/>
- <https://cffi.readthedocs.org/en/latest/>
- *Cython*

4.39.2 Cython

Wikipedia: <https://en.wikipedia.org/wiki/Cython>

Homepage: <http://cython.org/>

PyPI: <https://pypi.python.org/pypi/Cython>

Docs: <http://docs.cython.org/>

Docs: http://docs.cython.org/src/userguide/language_basics.html

Cython is a superset of *CPython* which adds static type definitions; making *CPython* code faster, in many cases.

4.39.3 NumPy

Wikipedia: <https://en.wikipedia.org/wiki/NumPy>

Homepage: <http://www.numpy.org/>

Src: <https://github.com/numpy/numpy>

Docs: <http://docs.scipy.org/doc/numpy/>

NumPy is a library of array-based mathematical functions implemented in *C* and *Python*.

- <http://nbviewer.ipython.org/github/jrjohansson/scientific-python-lectures/blob/master/Lecture-2-Numpy.ipynb>
- <https://scipy-lectures.github.io/intro/numpy/index.html>
- https://scipy-lectures.github.io/advanced/advanced_numpy/index.html

NumPy and other languages:

- http://wiki.scipy.org/NumPy_for_Matlab_Users
- <https://github.com/ipython/ipython/wiki/Extensions-Index>

4.39.4 SciPy

Wikipedia: <https://en.wikipedia.org/wiki/SciPy>

Homepage: <http://scipy.org/>

Src: <https://github.com/scipy/scipy>

Docs: <http://www.scipy.org/docs.html>

Docs: <http://docs.scipy.org/doc/scipy/reference/>

Docs: <http://www.scipy.org/install.html>

SciPy is a set of science and engineering libraries for *Python*, primarily written in *C*.

- <http://nbviewer.ipython.org/github/jrjohansson/scientific-python-lectures/blob/master/Lecture-3-Scipy.ipynb>
- <https://scipy-lectures.github.io/intro/scipy.html>

The *SciPy Stack* specification includes the SciPy package and its dependencies.

4.39.5 SciPy Stack

Docs: <http://www.scipy.org/stackspec.html>

Docs: <http://www.scipy.org/install.html>

Python Distributions

- Sage
- *Anaconda* (*Conda*)
- Enthought Canopy

- Python(x,y)
- WinPython
- Pyzo
- Algorete Loopy (*Conda*)

Scipy Stack Docker Containers

- <https://registry.hub.docker.com/u/ipython/ipython/>
- <https://registry.hub.docker.com/u/ipython/scipystack/>
- <https://registry.hub.docker.com/u/ipython/scipyserver/>

4.39.6 PyPy

Wikipedia: <https://en.wikipedia.org/wiki/PyPy>

Homepage: <http://pypy.org/>

Source: <https://bitbucket.org/pypy/pypy>

Docs: <http://buildbot.pypy.org/waterfall>

Docs: <https://pypy.readthedocs.org/en/latest/>

Docs: <https://pypy.readthedocs.org/en/latest/introduction.html>

PyPy is a JIT LLVM compiler for *Python* code written in RPython – a restricted subset of *CPython* syntax – which compiles to *C*, and is often faster than *CPython* for many types of purposes.

4.39.7 NumPyPy

NumPyPy is a port of *NumPy* to *PyPy*:

Src: <https://bitbucket.org/pypy/numppypy>

Docs: <http://buildbot.pypy.org/numpy-status/latest.html>

Docs: <http://pypy.org/numpydonate.html>

4.39.8 Python 3

Docs: <https://docs.python.org/3/>

Docs: <https://docs.python.org/3/howto/pyporting.html>

Docs: <https://docs.python.org/3/howto/cporting.html>

Docs: <http://learnxinyminutes.com/docs/python3/>

Python 3 made a number of incompatible changes, requiring developers to update and review their Python 2 code in order to “port to” Python 3.

Python 2 will be supported in “no-new-features” status for quite some time.

Python 3 Wall of Superpowers tracks which popular packages have been ported to support Python 3: <https://python3wos.appspot.com/>

There are a number of projects which help bridge the gap between the two language versions:

- <https://pypi.python.org/pypi/six>
- <http://pythonhosted.org/six/>
- <https://pypi.python.org/pypi/nine>
- https://github.com/nandoflorestan/nine/blob/master/nine/__init__.py
- <https://pypi.python.org/pypi/future>
- <http://python-future.org/>

The Anaconda Python distribution (*Conda*) maintains a working set of packages for Python 2.6, 2.7, 3.3, and 3.4: <http://docs.continuum.io/anaconda/pkg-docs.html>

4.39.9 awesome-python-testing

Homepage: <https://westurner.org/wiki/awesome-python-testing.html>

Source: <https://github.com/westurner/wiki/blob/master/awesome-python-testing.rest>

4.40 Pyline

Homepage: <https://github.com/westurner/pyline>

Docs: <https://pyline.readthedocs.org/en/latest/>

Source: git <https://github.com/westurner/pyline>

Pypi: <https://pypi.python.org/pypi/pyline>

Pyline is a UNIX command-line tool for line-based processing in Python with regex and output transform features similar to *Grep*, *Sed*, and *Awk*.

Pyline can generate quoted CSV, *JSON*, HTML, etc.

4.41 Pyrpo

Homepage: <https://github.com/westurner/pyrpo>

Source: git <https://github.com/westurner/pyrpo>

Pypi: <https://pypi.python.org/pypi/pyrpo>

Pyrpo is a tool for locating and generating reports from *Git*, *Mercurial*, *Bazaar*, and *Subversion* repositories.

4.42 Readline

Wikipedia: https://en.wikipedia.org/wiki/GNU_Readline

Homepage: <http://tiswww.case.edu/php/chet/readline/rltop.html>

Docs: <http://tiswww.case.edu/php/chet/readline/readline.html>

Docs: <http://tiswww.case.edu/php/chet/readline/history.html>
Docs: <http://tiswww.case.edu/php/chet/readline/rluserman.html>
Source: <ftp://ftp.gnu.org/gnu/readline/readline-6.3.tar.gz>
Pypi: <https://pypi.python.org/pypi/gnureadline>

4.43 ReStructuredText

Wikipedia: <https://en.wikipedia.org/wiki/ReStructuredText>
Homepage: <http://docutils.sourceforge.net/rst.html>
Docs: <http://docutils.sourceforge.net/docs/ref/rst/restructuredtext.html>
Docs: <http://docutils.sourceforge.net/docs/ref/rst/directives.html>
Docs: <http://docutils.sourceforge.net/docs/ref/rst/roles.html>
Docs: <http://sphinx-doc.org/rest.html>

ReStructuredText (RST, ReST) is a plaintext lightweight markup language commonly used for narrative documentation and Python docstrings.

Sphinx is built on *Docutils*, which is the primary implementation of ReStructuredText.

Pandoc also supports a form of ReStructuredText.

ReStructuredText Directive Actionable blocks of ReStructuredText

```
.. include:: goals.rst

.. contents:: Table of Contents
   :depth: 3

.. include:: LICENSE
```

ReStructuredText Role RestructuredText role extensions

```
.. _anchor-name:

:ref:`Anchor <anchor-name>`
```

4.44 Ruby

Wikipedia: [https://en.wikipedia.org/wiki/Ruby_\(programming_language\)](https://en.wikipedia.org/wiki/Ruby_(programming_language))
Homepage: <https://www.ruby-lang.org/>
Docs: <https://www.ruby-lang.org/en/documentation/>
Docs: <http://learnxinyminutes.com/docs/ruby/>
Source: [svn http://svn.ruby-lang.org/repos/ruby/trunk](http://svn.ruby-lang.org/repos/ruby/trunk)

Ruby is a dynamically-typed programming language.

Vagrant is written in Ruby.

4.45 Salt

Wikipedia: [https://en.wikipedia.org/wiki/Salt_\(software\)](https://en.wikipedia.org/wiki/Salt_(software))

Homepage: <http://www.saltstack.com>

Docs: <https://docs.saltstack.com/en/latest/>

Docs: <https://docs.saltstack.com/en/latest/salt-modindex.html>

Docs: <https://docs.saltstack.com/en/latest/ref/states/all/index.html>

Docs: <https://docs.saltstack.com/en/latest/ref/clients/index.html#python-api>

Docs: <https://docs.saltstack.com/en/latest/topics/development/hacking.html>

Docs: <https://docs.saltstack.com/en/latest/glossary.html>

Source: git <https://github.com/saltstack/salt>

Pypi: <https://pypi.python.org/pypi/salt>

IRC: #salt

Salt is an open source configuration management system for managing one or more physical and virtual machines running various operating systems.

Salt Top File Root of a Salt Environment (`top.sls`)

Salt Environment Folder of Salt States with a `top.sls` top file.

Salt Bootstrap Installer for salt master and/or salt minion

Salt Minion Daemon process which executes Salt States on the local machine.

Can run as a background daemon. Can retrieve and execute states from a salt master

Can execute local states in a standalone minion setup:

```
salt-call --local grains.items
```

Salt Minion ID Machine ID value uniquely identifying a minion instance to a Salt Master.

By default the minion ID is set to the FQDN

```
python -c 'import socket; print(socket.getfqdn())'
```

The minion ID can be set explicitly in two ways:

- `/etc/salt/minion.conf`:

```
id: devserver-123.example.org
```

- `/etc/salt/minion_id`:

```
$ hostname -f > /etc/salt/minion_id
$ cat /etc/salt/minion_id
devserver-123.example.org
```

Salt Master Server daemon which compiles pillar data for and executes commands on Salt Minions:

```
salt '*' grains.items
```

Salt SSH Execute salt commands and states over SSH without a minion process:

```
salt-ssh '*' grains.items
```

Salt Grains Static system information keys and values

- hostname
- operating system
- ip address
- interfaces

Show grains on the local system:

```
salt-call --local grains.items
```

Salt Modules Remote execution functions for files, packages, services, commands.

Can be called with salt-call

Salt States Graphs of nodes and attributes which are templated and compiled into ordered sequences of system configuration steps.

Naturally stored in `.sls` *YAML* files parsed by `salt.states.<state>.py`.

Salt States files are processed as Jinja templates (by default) they can access system-specific grains and pillar data at compile time.

Salt Renderers Templating engines (by default: Jinja) for processing templated states and configuration files.

Salt Pillar Key Value data interface for storing and making available global and host-specific values for minions: values like hostnames, usernames, and keys.

Pillar configuration must be kept separate from states (e.g. users, keys) but works the same way.

In a master/minion configuration, minions do not have access to the whole pillar.

Salt Cloud Salt Cloud can provision cloud image, instance, and networking services with various cloud providers (*Libcloud*):

- Google Compute Engine (GCE) [KVM]
- Amazon EC2 [Xen]
- Rackspace Cloud [KVM]
- OpenStack [<https://wiki.openstack.org/wiki/HypervisorSupportMatrix>]
- Linux LXC (Cgroups)
- KVM

4.46 Sed

Wikipedia: <https://en.wikipedia.org/wiki/Sed>

Homepage: <https://www.gnu.org/software/sed/>

Project: <https://savannah.gnu.org/projects/sed>

Docs: <https://www.gnu.org/software/sed/manual/>

Docs: <https://www.gnu.org/software/sed/manual/sed.html>

Docs: <http://sed.sourceforge.net/>

Source: [git git.savannah.gnu.org/sed.git](https://git.savannah.gnu.org/sed.git)

GNU Sed is a UNIX CLI utility for transforming text.

Note: BSD Sed

Use `<Ctrl-V><tab>` for explicit tabs (as `\t` does not work)

Use `\\n` or `'$'\n` for newlines (as `\n` does not work)

`sed -E` should be consistent extended regular expressions between GNU Sed (e.g. Linux) and BSD Sed (FreeBSD, OSX).

OR: `brew install gnu-sed`

See: <https://unix.stackexchange.com/questions/101059/sed-behaves-different-on-freebsd-and-on-linux>

See: <https://superuser.com/questions/307165/newlines-in-sed-on-mac-os-x>

4.47 Sphinx

Wikipedia: [https://en.wikipedia.org/wiki/Sphinx_\(documentation_generator\)](https://en.wikipedia.org/wiki/Sphinx_(documentation_generator))

Homepage: <https://pypi.python.org/pypi/Sphinx>

Docs: <http://sphinx-doc.org/contents.html>

Docs: <http://sphinx-doc.org/markup/code.html>

Docs: <http://pygments.org/docs/lexers/>

Docs: http://thomas-cokelaer.info/tutorials/sphinx/rest_syntax.html

Source: hg <https://bitbucket.org/birkenfeld/sphinx/>

Pypi: <https://pypi.python.org/pypi/Sphinx>

Sphinx is a tool for working with *ReStructuredText* documentation trees and rendering them into HTML, PDF, LaTeX, ePub, and a number of other formats.

Sphinx extends *Docutils* with a number of useful markup behaviors which are not supported by other ReStructuredText parsers.

Most other ReStructuredText parsers do not support Sphinx directives; so, for example,

- GitHub and BitBucket do not support Sphinx but do support ReStructuredText so README.rst containing Sphinx tags renders in plaintext or raises errors.

For example, the index page of this *Sphinx* documentation set is generated from a file named `index.rst` and referenced by `docs/conf.py`.

- Input: <https://raw.githubusercontent.com/westurner/provis/master/docs/index.rst>
- Output: <https://github.com/westurner/provis/blob/master/docs/index.rst>
- Output: *ReadTheDocs*: <http://provis.readthedocs.org/en/latest/>

Sphinx Builder Render Sphinx *ReStructuredText* into various forms:

- HTML
- LaTeX
- PDF
- ePub

See: [Sphinx Builders](#)

Sphinx ReStructuredText Sphinx extends *ReStructuredText* with roles and directives which only work with Sphinx.

Sphinx Directive Sphinx extensions of *Docutils ReStructuredText* directives.

Most other ReStructuredText parsers do not support Sphinx directives.

```
.. toctree::  
  
    readme  
    installation  
    usage
```

See: [Sphinx Directives](#)

Sphinx Role Sphinx extensions of *Docutils ReStructuredText* roles

Most other ReStructured

```
.. \_anchor-name:  
  
:ref:`Anchor <anchor-name>`
```

4.48 Tox

Homepage: <https://testrun.org/tox/>

Docs: <https://tox.readthedocs.org/en/latest/>

Source: hg <https://bitbucket.org/hpk42/tox>

Pypi: <https://pypi.python.org/pypi/tox>

Tox is a build automation tool designed to build and test Python projects with multiple language versions and environments in separate *virtualenvs*.

Run the py27 environment:

```
tox -v -e py27  
tox --help
```

4.49 Ubuntu

Wikipedia: [https://en.wikipedia.org/wiki/Ubuntu_\(operating_system\)](https://en.wikipedia.org/wiki/Ubuntu_(operating_system))

Homepage: <http://www.ubuntu.com/>

Docs: <https://help.ubuntu.com/>

Source: <https://launchpad.net/ubuntu>

Source: <http://archive.ubuntu.com/>

Source: <http://releases.ubuntu.com/>

4.50 Vagrant

Wikipedia: [https://en.wikipedia.org/wiki/Vagrant_\(software\)](https://en.wikipedia.org/wiki/Vagrant_(software))

Homepage: <https://www.vagrantup.com/>

Docs: <http://docs.vagrantup.com/v2/>

Source: git <https://github.com/mitchellh/vagrant>

Vagrant is a tool for creating and managing virtual machine instances with CPU, RAM, Storage, and Networking.

- Vagrant:
 - provides helpful commandline porcelain on top of *VirtualBox* VboxManage
 - installs *Vagrant Boxes*

```
vagrant help
vagrant status
vagrant init ubuntu/trusty64
vagrant up
vagrant ssh
$EDITOR Vagrantfile
vagrant provision
vagrant halt
vagrant destroy
```

Vagrantfile Vagrant script defining a team of one or more virtual machines and networks.

Create a Vagrantfile:

```
vagrant init [basebox]
cat Vagrantfile
```

Start virtual machines and networks defined in the Vagrantfile:

```
vagrant status
vagrant up
```

Vagrant Box Vagrant base machine virtual machine image.

There are many baseboxes for various operating systems.

Essentially a virtual disk plus CPU, RAM, Storage, and Networking metadata.

Locally-stored and cached vagrant boxes can be listed with:

```
vagrant help box
vagrant box list
```

A running vagrant environment can be packaged into a new box with:

```
vagrant package
```

Packer generates *VirtualBox* Vagrant Boxes with a Post-Processor.

Vagrant Cloud Vagrant-hosted public Vagrant Box storage.

Install a box from Vagrant cloud:

```
vagrant init ubuntu/trusty64
vagrant up
vagrant ssh
```

Vagrant Provider A driver for running Vagrant Boxes with a hypervisor or in a cloud.

The Vagrant *VirtualBox* Provider is well-supported.

With Plugins: <https://github.com/mitchellh/vagrant/wiki/Available-Vagrant-Plugins>

See also: *Libcloud*.

Vagrant Provisioner Set of hooks to install and run shell scripts and configuration management tools over `vagrant ssh`.

Vagrant up runs `vagrant provision` on first invocation of `vagrant up`.

<code>vagrant provision</code>

Note: Vagrant configures a default NFS share mounted at `/vagrant`.

Note: Vagrant adds a default NAT Adapter as `eth0`; presumably for DNS, the default route, and to ensure `vagrant ssh` connectivity.

4.52 VirtualBox

Wikipedia: <https://en.wikipedia.org/wiki/VirtualBox>
 Homepage: <https://www.virtualbox.org/>
 Docs: <https://www.virtualbox.org/wiki/Documentation>
 Source: `svn svn://www.virtualbox.org/svn/vbox/trunk`

Oracle VirtualBox is a platform virtualization package for running one or more guest VMs (virtual machines) within a host system.

VirtualBox:

- runs on many platforms: *Linux*, OSX, Windows
- has support for full platform NX/AMD-v virtualization
- requires matching kernel modules

Vagrant scripts VirtualBox.

4.53 Virtualenv

Homepage: <http://www.virtualenv.org>
 Docs: <https://virtualenv.pypa.io/en/latest/>
 Source: git <https://github.com/pypa/virtualenv>
 PyPI: <https://pypi.python.org/pypi/virtualenv>
 IRC: #pip

Virtualenv is a tool for creating reproducible *Python* environments.

Virtualenv sets the shell environment variable `$VIRTUAL_ENV` when active.

Virtualenv installs a copy of *Python*, *Setuptools*, and *Pip* when a new virtualenv is created.

A virtualenv is activated by source-ing `${VIRTUAL_ENV}/bin/activate`.

Paths within a virtualenv are more-or-less *FHS* standard paths, which makes virtualenv structure very useful for building chroot and container overlays.

A standard virtual environment:

```
bin/           # pip, easy_install, console_scripts
bin/activate   # source bin/activate to work on a virtualenv
include/       # (symlinks to) dev headers (python-dev/python-devel)
lib/          # libraries
lib/python2.7/distutils/
lib/python2.7/site-packages/ # pip and easy_installed packages
local/        # symlinks to bin, include, and lib
```

```
src/          # editable requirements (source repositories)

# also useful
etc/          # configuration
var/log       # logs
var/run       # sockets, PID files
tmp/         # mkstemp temporary files with permission bits
srv/         # local data
```

Virtualenvwrapper wraps *virtualenv*.

```
echo $PATH; echo $VIRTUAL_ENV
python -m site; pip list

virtualenv example          # mkvirtualenv example
source ./example/bin/activate # workon example

echo $PATH; echo $VIRTUAL_ENV
python -m site; pip list

ls -altr $VIRTUAL_ENV/lib/python*/site-packages/** # lssitepackages -altr
```

Note: *Venv* extends *Virtualenv* and *Virtualenvwrapper*.

Note: Python 3.3+ now also contain a script called **venv**, which performs the same functions and works similarly to *virtualenv*: <https://docs.python.org/3/library/venv.html>.

4.54 Virtualenvwrapper

Docs: <http://virtualenvwrapper.readthedocs.org/en/latest/>

Source: hg <https://bitbucket.org/dhellmann/virtualenvwrapper>

PyPI: <https://pypi.python.org/pypi/virtualenvwrapper>

Virtualenvwrapper is a tool which extends *virtualenvwrapper*.

Virtualenvwrapper provides a number of useful shell commands and python functions for working with and within *virtualenvs*, as well as project event scripts (e.g. `postactivate`, `postmkvirtualenv`) and two filesystem configuration variables useful for structuring development projects of any language within *virtualenvs*: `$PROJECT_HOME` and `$WORKON_HOME`.

Virtualenvwrapper is sourced into the shell:

```
# pip install --user --upgrade virtualenvwrapper
source ~/.local/bin/virtualenvwrapper.sh

# sudo apt-get install virtualenvwrapper
source /etc/bash_completion.d/virtualenvwrapper
```

Note: *Venv* extends *Virtualenv* and *Virtualenvwrapper*.

```
echo $PROJECT_HOME; echo ~/workspace          # venv: ~/wrk
cd $PROJECT_HOME                               # venv: cdp; cdph
```

```

echo $WORKON_HOME; echo ~/.virtualenvs          # venv: ~/wrk/.ve
cd $WORKON_HOME                                # venv: cdwh; cdwrk

mkvirtualenv example
workon example                                # venv: we example

cdvirtualenv; cd $VIRTUAL_ENV                  # venv: cdv
echo $VIRTUAL_ENV; echo ~/.virtualenvs/example # venv: ~/wrk/.ve/example

mkdir src ; cd src/                          # venv: cds; cd $_SRC

pip install -e git+https://github.com/westurner/dotfiles#egg=dotfiles

cd src/dotfiles; cd $VIRTUAL_ENV/src/dotfiles # venv: cdw; cds dotfiles
head README.rst

                                           # venv: cdpylib
cdsitepackages                               # venv: cdpysite
lssitepackages

deactivate
rmvirtualenv example

lsvirtualenvs; ls -d $WORKON_HOME              # venv: lsve; lsve 'ls -d'

```

4.55 Wayland

Wikipedia: [https://en.wikipedia.org/wiki/Wayland_\(display_server_protocol\)](https://en.wikipedia.org/wiki/Wayland_(display_server_protocol))

Homepage: <http://wayland.freedesktop.org/>

Source:

Wayland is a display server protocol for GUI window management.

Wayland is an alternative to *X11* servers like XFree86 and X.org.

The reference Wayland implementation, Weston, is written in *C*.

4.56 YAML

Wikipedia: <https://en.wikipedia.org/wiki/YAML>

Homepage: <http://yaml.org>

Docs: <http://learnxinyminutes.com/docs/yaml/>

YAML (“YAML Ain’t Markup Language”) is a concise data serialization format.

Most *Salt* states and pillar data are written in YAML. Here’s an example `top.sls` file:

```

base:
  '*':
    - openssh
  '*-webserver':

```

```
- webserver
'*-workstation':
- gnome
- i3
```

4.57 ZSH

Wikipedia: https://en.wikipedia.org/wiki/Z_shell

Homepage: <http://www.zsh.org/>

Docs: <http://zsh.sourceforge.net/Guide/zshguide.html>

Docs: <http://zsh.sourceforge.net/Doc/>

Source: `git git://git.code.sf.net/p/zsh/code`

- <https://github.com/robbyrussell/oh-my-zsh>

4.58 X11

Wikipedia: https://en.wikipedia.org/wiki/X_Window_System

Homepage: <http://www.x.org/>

Docs: <http://www.x.org/wiki/Documentation/>

Source: `git git://anongit.freedesktop.org/git/xorg/`

X Window System (X, X11) is a display server protocol for window management (drawing windows on the screen).

Most UNIX and *Linux* systems utilize XFree86 or the newer X.org X11 window managers.

Gnome, *KDE*, *I3wm*, *OS X*, and *Compiz* build upon X11.

^{top}

Dotfiles API

dotfiles

5.1 Subpackages

5.1.1 dotfiles.cli package

Submodules

dotfiles.cli.cli module

dotfiles commandline interface (CLI)

`dotfiles.cli.cli.get_pkg_resource_filename(path='')`

This package generates a MANIFEST.in file from version control (hg) in order to include files outside of the package source directory (src/dotfiles).

When installed as an editable or a source dist, these additional data files have paths relative to `pkg_resource.resource_filename`.

Parameters `path` (*str*) – path fragment (eg. `etc/vim`)

Returns `path` – absolute path to `path`, relative to this package install

Return type `str`

`class dotfiles.cli.cli.Test_dotfiles(methodName='runTest')`

Bases: `unittest.case.TestCase`

`test_get_pkg_resource_filename()`

`test_dotfiles_main()`

`dotfiles.cli.cli.main(*args)`

Main method for the dotfiles CLI script.

Parameters `args` (*list*) – list of arguments (if empty, read `sys.argv[1:]`)

5.1.2 dotfiles.venv package

Objectives

dotfiles.venv.ipython_config (ipython_config.py):

- Set variables for standard *Virtualenv* paths in the environment dict
- Define *IPython* aliases
- Serialize variables and aliases to:
 - *IPython* configuration (variables, aliases)
 - *Bash/ZSH* configuration (variables, aliases, functions):
 - * `venv -E --bash`
 - * `venv dotfiles --bash`
 - *JSON* (variables, aliases) [`--print`]
 - * `venv -E --json`
 - * `venv dotfiles json`

dotfiles.venv.ipython_magics (ipython_magics.py):

- Configure *IPython* `%magic` commands
 - `cd*` – change directories (`%cdhelp`, `%cdp`, `%cdwh`, `%cdv`, `%cds`, `%cdw`)
 - `ds` – print `dotfiles_status`

Configuration

Shell

For Bash/ZSH, `etc/bash/10-bashrc.venv.sh` sets:

```
# ...
_VENV="${__DOTFILES}/etc/ipython/ipython_config.py"
venv() {
    $_VENV $@
}
# ...
```

`etc/bash/10-bashrc.venv.sh` is sourced by `etc/bash/00-bashrc.before.sh`, which is sourced by `~/.bashrc` (a symlink to `${__DOTFILES}/etc/.bashrc` created by *bootstrap_dotfiles.sh -S*).

IPython

To configure IPython with `venv`, `ipython_config.py` must be symlinked into `~/.ipython/profile_default` (and, optionally, `ipython_magics.py` into `~/.ipython/profile_default/startup/`):

```
# symlink paths relative to ${__DOTFILES}
__DOTFILES="${__DOTFILES}/-dotfiles"

# working directory (path to the dotfiles repository)
_WRD=${WORKON_HOME}/dotfiles/src/dotfiles
```

```
# created by ``bootstrap_dotfiles.sh -S``
# ln -s ${_WRD} ${__DOTFILES}
# ln -s ${__DOTFILES}/etc/bashrc ~/.bashrc
# ln -s ${_WRD}/etc/ipython/ipython_config.py \
#     ${__DOTFILES}/etc/ipython/ipython_config.py

# MANUALLY INSTALL for each IPython profile
IPY_PROFILE="profile_default"
ln -s ${__DOTFILES}/etc/ipython/ipython_config.py \
    ~/.ipython/${IPY_PROFILE}/ipython_config.py

ln -s ${__DOTFILES}/etc/ipython/ipython_magics.py \
    ~/.ipython/${IPY_PROFILE}/ipython_magics.py
```

Submodules

dotfiles.venv.ipython_config module

class dotfiles.venv.ipython_config.**CdAlias** (*pathvar*, *name=None*, *aliases=None*)

Bases: *dotfiles.venv.ipython_config.CmdAlias*

A CmdAlias for cd change directory functions with venv paths (e.g. \$_WRD) for Bash, ZSH, IPython, Vim.

- venv.sh bash functions with tab-completion (cdwrld, cdw, cdw<tab>)
- ipython_magics.py: ipython magics (%cdwrld, cdwrld, cdw)
- venv.vim: vim functions (:Cdwrld)

__str__()

Returns eval ‘{_to_bash_function()}'

Return type str

bash_func_name

****Returns*** – str* – e.g. “cdwrld”

bash_func_names

****Returns*** – list* – self.bash_func_name + self.aliases

to_bash_function (*include_completions=True*)

Keyword Arguments **include_completions** (*bool*) – generate inline Bash completions

Returns bash function block

Return type str

to_ipython_method()

Keyword Arguments **include_completions** (*bool*) – generate inline Bash completions

Returns ipython method block

Return type str

to_shell_str()

Returns eval ‘{_to_bash_function()}'

Return type str

to_vim_function()

Returns vim function block

Return type str

vim_cmd_name

****Returns*** – str* – e.g “Cdwrđ”

vim_cmd_names

****Returns*** – list* – self.vim_cmd_name + self.aliases.title()

class dotfiles.venv.ipython_config.**CmdAlias** (*cmdstr*)

Bases: object

__repr__ (*name=None*)

Generate an alias or function for bash/zsh

Keyword Arguments **name** (*str*) – funcname to override default

Returns self.cmdstr (AS-IS)

Return type str

__str__ (*name=None*)

Generate an alias or function for bash/zsh

Keyword Arguments **name** (*str*) – funcname to override default

Returns self.cmdstr (AS-IS)

Return type str

to_ipython_alias()

Generate an alias for IPython

Returns self.cmdstr (AS-IS)

Return type str

to_shell_str (*name=None*)

Generate an alias or function for bash/zsh

Keyword Arguments **name** (*str*) – funcname to override default

Returns self.cmdstr (AS-IS)

Return type str

to_vim_function()

Generate a vim function

Raises

- `NotImplemented` – See `IpyAlias.to_vim_function`
- `str` – `self.cmdstr` (AS-IS)

exception `dotfiles.venv.ipython_config.ConfigException`

Bases: `exceptions.Exception`

class `dotfiles.venv.ipython_config.Env(*args, **kwargs)`

Bases: `object`

OrderedDict of variables for/from `os.environ`.

compress_paths (*path_*, *keys=None*, *keyname=None*)

Given an arbitrary string, replace absolute paths (starting with '/') with the longest matching Env path variables.

Parameters *path* (*str*) – a path string

Returns path string containing `${VARNAME}` variables

Return type `str`

copy ()

classmethod **from_environ** (*environ*, *verbose=False*)

Build an Env from a dict (e.g. `os.environ`)

Parameters

- **environ** (*dict*) – a dict with variable name keys and values
- **verbose** (*bool*) – whether to be verbose about dict merging

Returns an Env environment built from the given environ dict

Return type *Env*

get (*k*, *default=None*)

iteritems ()

iteritems_environ ()

iterkeys ()

logevent (*args, **kwargs)

name

ndiff (*other_env*)

Parameters *other_env* (*Env*) – env to compare with

Returns strings from `difflib.ndiff`

Return type `iterable`

osenviron_keys = `OrderedDict`([(('__WRK', '\${HOME}/-wrk'),), ('__SRC', '\${__WRK}/-src'), ('__DOTFILES', '\${HOME}/-dotfiles'), ('__VIMBIN', '\${HOME}/-vimbin'), ('__VIMCONF', '\${HOME}/-vimconf'), ('__EDITOR', '\${HOME}/-editor')])

osenviron_keys_classic = ('VIMBIN', 'GVIMBIN', 'MVIMBIN', 'GUIVIMBIN', 'VIMCONF', 'EDITOR', 'EDITORRC')

to_dict ()

to_json (*args, **kwargs)

to_string_iter (**kwargs)

class `dotfiles.venv.ipython_config.IpyAlias` (*cmdstr*, *name=None*)

Bases: `dotfiles.venv.ipython_config.CmdAlias`

An IPython alias command string which expands to a shell function `aliasname()` { ... } and handles positional args `%s` and `%l`

References

- TODO: IPython docs

to_shell_str (*name=None*)

Generate an alias or function for bash/zsh

Keyword Arguments *name* (*str*) – funcname to override default

Returns

an alias or a function()

```
alias name=repr(cmdstr)
# or
cmdname () {
    cmdstr
}
```

Return type `str`

class `dotfiles.venv.ipython_config.PrintEnvStderrStep` (*func=None*, ***kwargs*)

Bases: `dotfiles.venv.ipython_config.PrintEnvStep`

Print env and kwargs to stderr

stdout = <open file '<stderr>', mode 'w'>

class `dotfiles.venv.ipython_config.PrintEnvStep` (*func=None*, ***kwargs*)

Bases: `dotfiles.venv.ipython_config.Step`

Print env and kwargs to stdout

func (*env=None*, ***kwargs*)

Default `build_*_env` Step.func function to print env

Keyword Arguments

- **env** (*Env*) – Env object (default: None)
- **kwargs** (*dict*) – kwargs dict

Returns updated Env

Return type `Env`

stderr = <open file '<stderr>', mode 'w'>

stdout = <open file '<stdout>', mode 'w'>

class `dotfiles.venv.ipython_config.Step` (*func=None*, ***kwargs*)

Bases: `object`

A build task step which builds or transforms an Env, by calling `step.build(env=env, **step.conf)`

DEFAULT_FUNC (*env=None, **kwargs*)

Default build_*_env Step.func function to print env

Keyword Arguments

- **env** (*Env*) – Env object (default: None)
- **kwargs** (*dict*) – kwargs dict

Returns updated Env

Return type *Env*

asdict ()

Returns OrderedDict(self._iteritems())

Return type OrderedDict

build (*env=None, **kwargs*)

Call self.func(env=env, **self.conf.copy().update(**kwargs))

Keyword Arguments

- **env** (*Env*) – Env object (default: None)
- **kwargs** (*dict*) – kwargs dict

Returns self.func(env=env, **self.conf.copy().update(**kwargs))

Return type obj

build_print_kwargs_env (*env=None, **kwargs*)

Default build_*_env Step.func function to print env

Keyword Arguments

- **env** (*Env*) – Env object (default: None)
- **kwargs** (*dict*) – kwargs dict

Returns updated Env

Return type *Env*

func (*env=None, **kwargs*)

Default build_*_env Step.func function to print env

Keyword Arguments

- **env** (*Env*) – Env object (default: None)
- **kwargs** (*dict*) – kwargs dict

Returns updated Env

Return type *Env*

name

****Returns*** – str* – a name for this Step

class dotfiles.venv.ipython_config.**StepBuilder** (***kwargs*)

Bases: object

A class for building a sequence of steps which modify env

add_step (*func, **kwargs*)

Add a step to self.steps

Parameters

- **func** (*Step or function or str*) – func (env=None, **kwargs)
- **kwargs** (*dict*) – kwargs for Step.conf

Keyword Arguments **name** (*str*) – function name (default: None)

Returns Step object appended to self.steps

Return type Step

build (*args, **kwargs)

Build a list of Envs from self.build_iter(*args, **kwargs) and return the last Env.

Keyword Arguments **debug** (*bool*) – log.debug(env)

Returns the last env returned from .build_iter

Return type Env or None

build_iter (env=None, show_diffs=True, debug=False)

Build a generator of (Step, Env) tuples from the functional composition of StepBuilder.steps given an initial Env (or None).

```
# pseudocode
env_previous = Env()
for step in self.steps:
    (step, env) = step.build(env=env_previous.copy(), **conf)
    env_previous=env
```

Keyword Arguments

- **env** (*Env*) – initial Env (default: None)
- **show_diffs** (*bool*) – show difflib.ndiffs of Envs between steps
- **debug** (*bool*)

Yields *tuple* – (Step, Env)

debug

****Returns*** – str* – self.conf.get('debug')

name

show_diffs

****Returns*** – str* – self.conf.get('show_diffs')

exception dotfiles.venv.ipython_config.**StepConfigException**

Bases: *dotfiles.venv.ipython_config.StepException, dotfiles.venv.ipython_config.ConfigException*

exception dotfiles.venv.ipython_config.**StepException**

Bases: *exceptions.Exception*

class dotfiles.venv.ipython_config.**Test_001_lookup** (*methodName='runTest'*)

    open_editors=False, open_terminals=False,
    dont_reflect=True, debug=False, show_diffs=False,
    **kwargs)

    Bases: object

    A virtual environment configuration generator

    PROJECT_FILES

    aliases
        **Returns* – OrderedDict – self.env.aliases

    build (env=None, VENVSTR=None, VENVSTRAPP=None, VENVPREFIX=None,
        from_environ=False, dont_reflect=True, debug=False, show_diffs=False)
        Build Venv Steps with StepBuilder

    call (command)

        Parameters command (str) – command to run

        Returns output from subprocess.call

        Return type str
```

configure_ipython (*args, **kwargs)

Configure IPython with Venv._configure_ipython and user_aliases from self.aliases.items().

Parameters

- **args** (*list*) – args for Venv._configure_ipython
- **kwargs** (*dict*) – kwargs for Venv._configure_ipython.

configure_sys ()

Returns sys.path list from _configure_sys.

Return type list

generate_bash_cdalias ()

Generate a source-able script for cdalias functions

Yields *str* – block of bash script

generate_bash_env (shell_keyword='export ', shell_quotefunc=<function shell_quote>, include_paths=True, include_aliases=True, include_cdaliases=False, **kwargs)

Generate a source-able script for the environment variables, aliases, and functions defined by the current Venv.

Keyword Arguments

- **shell_keyword** (*str*) – shell variable def (default: “export ”)
- **include_paths** (*bool*) – Include environ vars in output (default: True)
- **include_aliases** (*bool*) – Include aliases in output (default: True)
- **include_cdaliases** (*bool*) – Include cdaliases in output (default: False)
- **compress_paths** (*bool*) – Compress paths to \$VAR (default=False)

Yields *str* – block of bash script

generate_ipython_magics ()

Generate an ipython_magics.py file for IPython

Yields *str* – block of Python code

generate_vars_env (**kwargs)

Generate a string containing VARIABLE='./value'

generate_vim_cdalias ()

Generate a source-able vimscript for vim

Yields *str* – block of vim script

open_editors ()

Run self._edit_project_cmd

open_terminals ()

Run self._open_terminals_cmd

static parse_VENVSTR (env=None, VENVSTR=None, VENVSTRAPP=None, VENVPREFIX=None, VIRTUAL_ENV=None, VIRTUAL_ENV_NAME=None, _APP=None, _SRC=None, _WRD=None, _Venv_WRK=None, WORKON_HOME=None, from_environ=False, **kwargs)

Get the path to a virtualenv given a VENVSTR

Keyword Arguments

- **env** (*Env*)
- **VENVSTR** (*str*) – a path to a virtualenv containing / OR just the name of a virtualenv in `$WORKON_HOME`
- **VENVSTRAPP** (*str*)
- **VENVPREFIX** (*str*)
- **WORKON_HOME** (*str*)
- **from_environ** (*bool*) – whether to try and read from `os.environ["VIRTUAL_ENV"]`

Returns a path to a virtualenv (for `$VIRTUAL_ENV`)

Return type `str`

project_files

system (*cmd=None*)

Call `os.system` with the given command string

Parameters **cmd** (*string*) – command string to call `os.system` with

Raises

- `Exception` – if `cmd` is `None`
- `NotImplementedError` – if `cmd` is a tuple

to_dict ()

Returns `OrderedDict(env=self.env, aliases=self.aliases)`

Return type `OrderedDict`

to_json (*indent=None*)

Parameters **indent** (*int*) – number of spaces with which to indent JSON output

Returns `json.dumps(self.to_dict())`

Return type `str`

static update_os_environ (*venv, environ=None*)

Update `os.environ` for the given `venv`

Parameters **environ** (*dict*) – if `None`, defaults to `os.environ`

Returns updated `environ` dict

Return type `dict`

classmethod workon (*env=None, VENVSTR=None, VENVSTRAPP=None, **kwargs*)

Parameters

- **VENVSTR** (*str*) – a path to a virtualenv containing / OR just the name of a virtualenv in `$WORKON_HOME`
- **VENVSTRAPP** (*str*) – e.g. `dotfiles` or `dotfiles/docs`
- **kwargs** (*dict*) – kwargs to pass to `Venv` (see `Venv.__init__`)

Returns an initialized `Venv`

Return type `Venv`

```
class dotfiles.venv.ipython_config.VenvJSONEncoder (skipkeys=False, ensure_ascii=True,
                                                    check_circular=True,
                                                    low_nan=True, sort_keys=False,
                                                    indent=None, separators=None,
                                                    encoding='utf-8', default=None)
```

Bases: `json.encoder.JSONEncoder`

default (*obj*)

```
class dotfiles.venv.ipython_config.VenvTestUtils
```

Bases: `object`

Test fixtures for TestCases and examples

static build_env_test_fixture (*env=None*)

static capture_io (*f*)

Add stdout and stderr kwargs to a function call and return (output, _stdout, _stderr)

```
dotfiles.venv.ipython_config.build_conda_cfg_env (env=None, **kwargs)
```

Configure conda for a specific environment TODO build_venv_config

Parameters *env* (*Env dict*) – `dotfiles.venv.ipython_config.Env`

Returns *env* – `dotfiles.venv.ipython_config.Env`

Return type `Env dict`

```
dotfiles.venv.ipython_config.build_conda_env (env=None, **kwargs)
```

Configure conda27 (2.7) and conda (3.4) with condaenvs in `-wrk/-ce27` and `-wrk/ce34`.

Other Parameters

- **__WRK** (*str*) – workspace root (`$__WRK`, `~/-wrk`)
- **CONDA_ROOT__py27** (*str*) – path to conda27 root environment
- **CONDA_HOME__py27** (*str*) – path to conda27 envs (e.g. `WORKON_HOME`)
- **CONDA_ROOT__py34** (*str*) – path to conda34 root environment
- **CONDA_HOME__py34** (*str*) – path to conda34 envs (e.g. `WORKON_HOME`)

Keyword Arguments *env* (*Env dict*) – `dotfiles.venv.ipython_config.Env`

Returns *env* – `dotfiles.venv.ipython_config.Env`

Return type `Env dict`

```
dotfiles.venv.ipython_config.build_dotfiles_env (env=None, **kwargs)
```

Configure dotfiles base environment (`HOME`, `__WRK`, `__SRC`, `__DOTFILES`)

Keyword Arguments

- **env** (*Env dict*) – `dotfiles.venv.ipython_config.Env`
- **HOME** (*str*) – home path (`$HOME`, `~`)
- **__WRK** (*str*) – workspace path (`$__WRK`, `~/-wrk`)
- **__SRC** (*str*) – path to source repos (`$__WRK/-src`)
- **__DOTFILES** (*str*) – current dotfiles path (`~/-dotfiles`)

Returns

env – `dotfiles.venv.ipython_config.Env`

Sets:

- HOME
- __WRK
- __SRC
- __DOTFILES

Return type Env dict

```
dotfiles.venv.ipython_config.build_user_aliases_env(env=None, dont_reflect=False,
                                                    VIRTUAL_ENV=None,
                                                    _SRC=None, _ETC=None,
                                                    _CFG=None,
                                                    PROJECT_FILES=None,
                                                    **kwargs)
```

Configure env variables and return an OrderedDict of aliases

Parameters **dont_reflect** (*bool*) – Whether to always create aliases and functions referencing `$_WRD` even if `$_WRD` doesn't exist. (default: False)

Returns dict of aliases

Return type OrderedDict

```
dotfiles.venv.ipython_config.build_usrlog_env(env=None, _TERM_ID=None,
                                              shell='bash', prefix=None,
                                              USER=None, HOSTNAME=None,
                                              lookup_hostname=False, **kwargs)
```

Build environment variables and configuration like `usrlog.sh`

Keyword Arguments

- **env** (*Env dict*) – `dotfiles.venv.ipython_config.Env`
- **_TERM_ID** (*str*) – terminal identifier string
- **shell** (*str*) – shell name (“bash”, “zsh”)
- **prefix** (*str*) – a path prefix (e.g. `$VIRTUAL_ENV` or `$PREFIX`)
- **USER** (*str*) – system username (`$USER`) for HISTTIMEFORMAT
- **HOSTNAME** (*str*) – system hostname (`HOSTNAME`) for HISTTIMEFORMAT
- **lookup_hostname** (*bool*) – if True, `HOSTNAME` is None, and not `env.get('HOSTNAME')`, try to read `HOSTNAME` from `os.environ` and then `socket.gethostname()`.

Returns **env** – `dotfiles.venv.ipython_config.Env`

Return type Env dict

Note: Like `usrlog.sh`, when `HISTTIMEFORMAT` is set, `USER` and `HOSTNAME` must be evaluated.

(When `USER` and `HOSTNAME` change, `HISTTIMEFORMAT` is not updated, and the `.history` file will contain only the most recent `USER` and `HOSTNAME` settings, which are not necessarily the actual `USER` and `HOSTNAME`.)

TODO: could/should instead (also) write `USER` and `HOSTNAME` to `-usrlog.log`.

```
dotfiles.venv.ipython_config.build_venv_activate_env(env=None, VENVSTR=None,
                                                    VENVSTRAPP=None,
                                                    from_environ=False, VENV-
                                                    VPREFIX=None, VIR-
                                                    TUAL_ENV=None, VIR-
                                                    TUAL_ENV_NAME=None,
                                                    _APP=None, _SRC=None,
                                                    _WRD=None, **kwargs)
```

```
dotfiles.venv.ipython_config.build_venv_arg_parser()
```

Returns options for the commandline interface

Return type optparse.OptionParser

```
dotfiles.venv.ipython_config.build_venv_paths_cdalias_env(env=None, **kwargs)
```

Build CdAliases for standard paths

Keyword Arguments *env* (*Env dict*) – *Env*

Returns *env* – *Env* with `.aliases` extended.

Return type Env dict

Note: These do not work in IPython as they run in a subshell. See: [dotfiles.venv.ipython_magics](#).

```
dotfiles.venv.ipython_config.build_venv_paths_full_env(env=None, pyver=None,
                                                    **kwargs)
```

Set variables for standard paths in the environment

Keyword Arguments

- *env* (*Env dict*) – *dotfiles.venv.ipython_config.Env* (default: None (*Env*()))
- **VENVPREFIX** (*str*) – venv prefix path (default: None (*VIRTUAL_ENV*))
- **VENVSTR** (*str*) – name of a *VIRTUAL_ENV* in *WORKON_HOME* or path to a *VIRTUAL_ENV* (default: None)
- **VIRTUAL_ENV** (*str*) – path to a *VIRTUAL_ENV* (default: None)

Returns *env* – *dotfiles.venv.ipython_config.Env*

Return type Env dict

Raises *StepConfigException* – When not any((*VIRTUAL_ENV*, *VENVPREFIX*, *VEN-
VSTR*, *VENVSTRAPP*))

References

- https://en.wikipedia.org/wiki/Unix_directory_structure
- https://en.wikipedia.org/wiki/Filesystem_Hierarchy_Standard

```
dotfiles.venv.ipython_config.build_virtualenvwrapper_env(env=None, **kwargs)
```

Set *WORKON_HOME* to *WORKON_HOME* or *WORKON_HOME_DEFAULT*

Keyword Arguments

- *env* (*Env dict*) – *dotfiles.venv.ipython_config.Env*
- **__WRK** (*str*) – workspace path (`$__WRK`, `~/wrk`)

- **WORKON_HOME_DEFAULT** (*str*) – variable name (default: WORKON_HOME__py27)
- **WORKON_HOME__*** (*str*) – path to a WORKON_HOME set

Returns

env – `dotfiles.venv.ipython_config.Env`

Sets:

- WORKON_HOME__py27='\${__WRK}/-ve27'
- WORKON_HOME__py34='\${__WRK}/-ve34'
- WORKON_HOME__*=kwargs.get(WORKON_HOME__*)
- WORKON_HOME_DEFAULT='WORKON_HOME_py27'

Return type Env dict

`dotfiles.venv.ipython_config.comment_comment` (*strblock*, ***kwargs*)

Parameters *strblock* (*str*) – string block (possibly containing newlines)

Keyword Arguments *kwargs* (*dict*) – kwargs for prepend_comment_char

Returns string with each line prefixed with comment char

Return type str

`dotfiles.venv.ipython_config.get_IPYTHON_ALIAS_DEFAULTS` (*platform=None*)

`dotfiles.venv.ipython_config.get_IPYTHON_ALIAS_OVERLAY` ()

`dotfiles.venv.ipython_config.get_USRLOG_ALIAS_OVERLAY` ()

`dotfiles.venv.ipython_config.get_WORKON_HOME_default` (*env=None*,
from_environ=False,
default='-ve27', ***kwargs*)

Keyword Arguments

- **env** (*dict*) – Env dict to read from (default: None)
- **from_environ** (*bool*) – read WORKON_HOME from os.environ
- **default** (*str*) – default WORKON_HOME dirname
- **__WRK** (*str*)

Returns path to a WORKON_HOME directory

Return type str

`dotfiles.venv.ipython_config.get__WRK_default` (*env=None*, ***kwargs*)

`dotfiles.venv.ipython_config.get_pyver` (*pyverstr=None*)

Parameters *pyver* (*str*) – “major.minor” e.g. 2.7 or 3.4 (default: `sys.version_info[:2]`)

Returns python2.7, python.34

Return type str

`dotfiles.venv.ipython_config.in_ipython_config` ()

Returns True if get_ipython is in globals ()

Return type bool

`dotfiles.venv.ipython_config.ipython_imports()`

Default imports for IPython (currently unused)

`dotfiles.venv.ipython_config.ipython_main()`

Function to call if running within IPython, as determined by `in_ipython_config`.

`dotfiles.venv.ipython_config.logevent(event, obj=None, logger=<logging.Logger object>, level=10, func=None, lineno=None, modpath=None, show_modpath=None, wrap=False, splitlines=True)`

Parameters

- **event** (*str*) – an event key
- **obj** (*thing*) – thing to serialize and log
- **logger** (*logging.Logger*) – logger to log to
- **level** (*int*) – logging loglevel to log (event, obj)
- **wrap** (*bool*) – Add header and footer <event> tags (default: False)
- **splitlines** (*bool*) – split by newlines and emit one log message per line

Returns (event:str, output:str)

Return type tuple

`dotfiles.venv.ipython_config.lookup_from_kwargs_env(kwargs, env, attr, default=None)`
`__getitem__` from kwargs, env, or default.

Parameters

- **kwargs** (*dict*) – kwargs dict
- **env** (*Env*) – Env dict
- **attr** (*str*) – attribute name
- **default** (*obj*) – default value to return if not found in kwargs or env

Returns `kwargs.get(attr, env.get(attr, default))`

Return type obj

`dotfiles.venv.ipython_config.main(*argv, **kwargs)`
 main function called if `__name__=="__main__"`

Returns nonzero on error

Return type int

`dotfiles.venv.ipython_config.prepend_comment_char(strblock, commentchar='##')`

Parameters

- **strblock** (*str*) – string to split by newlines and prepend
- **prefix** (*str*) – comment string prefix (one space will be added)

Yields *str* – lines prefixed with prefix

`dotfiles.venv.ipython_config.print(*args, **kwargs)`

`dotfiles.venv.ipython_config.shell_quote(var)`

Escape single quotes and add double quotes around a given variable.

Parameters **_str** (*str*) – string to add quotes to

Returns string wrapped in quotes

Return type str

Warning: This is not safe for untrusted input and only valid in this context (`os.environ`).

`dotfiles.venv.ipython_config.shell_varquote(str_)`

Add doublequotes and shell variable brackets to a string

Parameters `str` (*str*) – string to varquote (e.g. `VIRTUAL_ENV`)

Returns “`{VIRTUAL_ENV}`”

Return type str

dotfiles.venv.ipython_magics module

`dotfiles.venv.ipython_magics.magics_class(cls, *args, **kwargs)`

`dotfiles.venv.ipython_magics.line_magic(func, *args, **kwargs)`

class `dotfiles.venv.ipython_magics.VenvMagics`

Bases: `object`

cd (*envvar*, *line*)

Change directory

Parameters

- **envvar** (*str*) – `os.environ` variable name
- **line** (*str*) – path to append to `envvar`

cdhome (*line*)

`cdhome` – `cd $HOME/${@}`

cdh (*line*)

`cdh` – `cd $HOME/${@}`

cdwrk (*line*)

`cdwrk` – `cd $__WRK/${@}`

cddotfiles (*line*)

`cddotfiles` – `cd $__DOTFILES/${@}`

cdd (*line*)

`cdd` – `cd $__DOTFILES/${@}`

cdprojecthome (*line*)

`cdprojecthome` – `cd $PROJECT_HOME/${@}`

cdp (*line*)

`cdp` – `cd $PROJECT_HOME/${@}`

cdph (*line*)

`cdph` – `cd $PROJECT_HOME/${@}`

cdworkonhome (*line*)

`cdworkonhome` – `cd $WORKON_HOME/${@}`

cdwh (*line*)

`cdwh` – `cd $WORKON_HOME/${@}`

cdve (*line*)

`cdve` – `cd $WORKON_HOME/${@}`

```
cdcondahome (line)  
    cdcondahome – cd $CONDA_HOME/${@}  
  
cda (line)  
    cda – cd $CONDA_HOME/${@}  
  
cdce (line)  
    cdce – cd $CONDA_HOME/${@}  
  
cdvirtualenv (line)  
    cdvirtualenv – cd $VIRTUAL_ENV/${@}  
  
cdv (line)  
    cdv – cd $VIRTUAL_ENV/${@}  
  
cdsrc (line)  
    cdsrc – cd $_SRC/${@}  
  
cds (line)  
    cds – cd $_SRC/${@}  
  
cdwrld (line)  
    cdwrld – cd $_WRD/${@}  
  
cdw (line)  
    cdw – cd $_WRD/${@}  
  
cdbin (line)  
    cdbin – cd $_BIN/${@}  
  
cdb (line)  
    cdb – cd $_BIN/${@}  
  
cdetc (line)  
    cdetc – cd $_ETC/${@}  
  
cde (line)  
    cde – cd $_ETC/${@}  
  
cdlib (line)  
    cdlib – cd $_LIB/${@}  
  
cdl (line)  
    cdl – cd $_LIB/${@}  
  
cdlog (line)  
    cdlog – cd $_LOG/${@}  
  
cdpylib (line)  
    cdpylib – cd $_PYLIB/${@}  
  
cdpysite (line)  
    cdpysite – cd $_PYSITE/${@}  
  
cdsitepackages (line)  
    cdsitepackages – cd $_PYSITE/${@}  
  
cdvar (line)  
    cdvar – cd $_VAR/${@}  
  
cdwww (line)  
    cdwww – cd $_WWW/${@}
```

cdww (*line*)

cdww – cd \$_WWW/\${@}

cdhelp (*line*)

cdhelp() – list cd commands

dotfiles_status (*line*)

dotfiles_status() – print dotfiles_status() .

ds (*line*)

ds() – print dotfiles_status() .

dotfiles_reload (*line*)

dotfiles_reload() – print NotImplemented

dr (*line*)

dr() – print NotImplemented [dotfiles_reload()]

dotfiles.venv.ipython_magics.**main**()

Register VenvMagics with IPython

6.1 Create a virtualenv with virtualenvwrapper

Install **virtualenvwrapper** (with pip):

```
pi install --upgrade --user pip virtualenv
pip install --upgrade --user virtualenvwrapper
source $(HOME)/.local/bin/virtualenvwrapper.sh
```

Make a **virtualenv** for the **dotfiles** source with **virtualenvwrapper**:

```
mkvirtualenv dotfiles
workon dotfiles
cdvirtualenv
ls -ld **/**

mkdir -p ${VIRTUAL_ENV}/src
cdvirtualenv src
```

6.2 Install this package

- Install into `$VIRTUAL_ENV` (with pip):

```
workon dotfiles
pip install -e git+https://github.com/westurner/dotfiles#egg=dotfiles
```

6.3 Test and build this package

- Install into `$VIRTUAL_ENV` (manually):

```
cd ${VIRTUAL_ENV}/src
git clone https://github.com/westurner/dotfiles
hg clone https://bitbucket.org/westurner/dotfiles

cd dotfiles
ls -l ./dotfiles/**
hg paths || git remote -v && git branch -v

ls -l ./dotfiles/etc/vim/**
```

```
cd ./dotfiles/etc/vim
hg paths || git remote -v && git branch -v

cd ${VIRTUAL_ENV}/src/dotfiles
# cd $_WRD
# cdw
# pip install -e .
python setup.py develop
```

- Build

```
# sudo apt-get install make git mercurial

cd ${VIRTUAL_ENV}/src/dotfiles
echo $EDITOR
make build_tags
make edit
make test
make build
make install

# pip install -r ./requirements-all.txt
make pip_install_requirements_all
```

Changelog

7.1 0.01

- Created dotfiles project

Git Commit Log

Releases: <https://github.com/westurner/dotfiles/commits/master>

Development: <https://github.com/westurner/dotfiles/commits/develop>

make docs calls make help_bash_txt and make help_zsh_txt to aggregate initial configuration into one file (sans line numbers) for debugging and docstring extraction:

- src/dotfiles/venv/ipython_config.py
- etc/bash
- scripts/_dotfiles_bash.log.sh
- etc/zsh
- scripts/_dotfiles_zsh.log.sh

| | | Added chsh -s /usr/local/bin/bash for bash4 on OSX
| * | 7ad90be 2013-12-03 06:56:48 -0600 [Wes Turner]
| | | Added setup_mavericks_python.sh
| * | d240e7f 2013-12-03 06:52:24 -0600 [Wes Turner]
| | | Added setup_brew and brew.list

```

```

| * | 1b63dd3 2013-12-03 06:20:27 -0600 [Wes Turner]
| | | Updated .bashrc.venv.sh: don't source screensaver.sh on OSX
| * | 38c9cd9 2013-12-03 06:16:42 -0600 [Wes Turner]
| | | Added setup_powerline_fonts.sh from westurner/dotvim
| * | b17f5b9 2013-12-03 06:12:11 -0600 [Wes Turner]
| | | Added etc/terminal/profile-Homebrew-mod.terminal
| * | 07b6cc0 2013-12-03 05:56:57 -0600 [Wes Turner]
| | \ Merged aliases for hg and BSD ls
| | * | 3655672 2013-12-03 00:16:13 -0600 [Wes Turner]
| | | Updated .bashrv.venv.sh: added hgd and hgdl aliases for hg diff [|less]
| | * | b007282 2013-12-03 00:14:23 -0600 [Wes Turner]
| | | Updated .bashrv.venv.sh: added osx ls aliases (-G for color)
| * | 74760ae 2013-12-03 03:16:03 -0600 [Wes Turner]
| | / Updated ipython_config.py: fixed single-quotes in cdhelp function
| * | e15a4df 2013-12-02 23:59:14 -0600 [Wes Turner]
| | | Added requirements/, updated pavement.py: requirements to pip requirements.txt files
| * | fd39ee3 2013-12-02 23:46:47 -0600 [Wes Turner]
| | \ Merged with 378 (declare -> export)
| | * | b954355 2013-12-02 23:18:56 -0600 [Wes Turner]
| | | Updated ipython_config.py: declare [-g]rx -> export and removed extra call to _setup_editor
| | * | 4049f39 2013-12-02 23:18:20 -0600 [Wes Turner]
| | | Updated .bashrc.venv.sh: declare -rx -> export
| | * | f3afad8 2013-12-02 21:40:07 -0600 [Wes Turner]
| | | Commented out try/except import sympyprinting
| | * | a70bdd9 2013-12-02 20:21:58 -0600 [Wes Turner]
| | | Updated .hgignore: added etc/vim
| | * | b36cc7f 2013-12-02 20:19:05 -0600 [Wes Turner]
| | | Added scripts/setup_bashdb.sh
| | * | 2e48317 2013-12-02 19:44:12 -0600 [Wes Turner]
| | | Added etc/elinks.conf
| | * | aeaa2ed 2013-12-02 19:43:11 -0600 [Wes Turner]
| | | Updated screensaver.sh: i3lock forks (and works with _suspend_to_ram)
| | * | 159a0ff 2013-11-29 08:07:36 -0600 [Wes Turner]
| | | Always xlock (i3lock = intelligence)
| | * | 15bd1f1 2013-11-29 08:07:18 -0600 [Wes Turner]
| | | Added .xinitrc and _install_screensaver function
| | * | 4860bf8 2013-11-29 06:27:21 -0600 [Wes Turner]
| | | Updated twitter-add_tweet_link.js to point to https://twitter.com/intent/tweet
| | * | 877dbdf 2013-11-29 06:26:42 -0600 [Wes Turner]
| | | Moved twitter-add_share_link.js to twitter-add_tweet_link.js
| | * | aa94c0d 2013-11-29 06:22:26 -0600 [Wes Turner]
| | | Added twitter-add_share_link.js to css/ folder
| | * | 3c5dlfb 2013-11-29 06:01:17 -0600 [Wes Turner]
| | | Added twitter-hide_sidebar.css
| | * | 7d8d89d 2013-11-29 06:01:03 -0600 [Wes Turner]
| | | Added gmail-hide_sidebar.css
| | * | fea8410 2013-11-29 04:55:46 -0600 [Wes Turner]
| | | Updated ls aliases and check for MVIMBIN. TODO: set a more generic variable for OSX
| | * | 4d889de 2013-11-29 04:51:18 -0600 [Wes Turner]
| | | +Shift+b launches x-www-browser
| | * | a977454 2013-11-29 00:47:01 -0600 [Wes Turner]
| | | Added listpath.sh
| | * | b9b5ea0 2013-11-29 00:45:00 -0600 [Wes Turner]
| | | Added nowireless.sh dbus script
| | * | f4f6f4d 2013-11-29 00:44:43 -0600 [Wes Turner]
| | | Added pianobar_install.sh
| | * | 6d69d50 2013-11-29 00:43:49 -0600 [Wes Turner]
| | | Added setup_f.lux.sh

```

```

| | | | * | f9eb03b 2013-12-03 06:56:48 -0600 [Wes Turner]
| | | | | | Added setup_mavericks_python.sh
| | | | * | 507e56a 2013-12-03 06:52:24 -0600 [Wes Turner]
| | | | | | Added setup_brew and brew.list
| | | | * | ad94764 2013-12-03 06:20:27 -0600 [Wes Turner]
| | | | | | Updated .bashrc.venv.sh: don't source screensaver.sh on OSX
| | | | * | 277e80b 2013-12-03 06:16:42 -0600 [Wes Turner]
| | | | | | Added setup_powerline_fonts.sh from westurner/dotvim
| | | | * | f37c917 2013-12-03 06:12:11 -0600 [Wes Turner]
| | | | | | Added etc/terminal/profile-Homebrew-mod.terminal
| | | | * | aec50d2 2013-12-03 05:56:57 -0600 [Wes Turner]
| | | | | \ \ Merged aliases for hg and BSD ls
| | | | * | 46c6f64 2013-12-03 00:16:13 -0600 [Wes Turner]
| | | | | | Updated .bashrv.venv.sh: added hgd and hgdl aliases for hg diff [|less]
| | | | * | 4ea468c 2013-12-03 00:14:23 -0600 [Wes Turner]
| | | | | | Updated .bashrv.venv.sh: added osx ls aliases (-G for color)
| | | | * | 18e441d 2013-12-03 03:16:03 -0600 [Wes Turner]
| | | | | / / Updated ipython_config.py: fixed single-quotes in cdhelp function
| | | | * | 5ffd724 2013-12-02 23:59:14 -0600 [Wes Turner]
| | | | | | Added requirements/, updated pavement.py: requirements to pip requirements.txt files
| | | | * | 26f0875 2013-12-02 23:46:47 -0600 [Wes Turner]
| | | | | \ \ Merged with 378 (declare -> export)
| | | | * | d726dc3 2013-12-02 23:18:56 -0600 [Wes Turner]
| | | | | | Updated ipython_config.py: declare [-g]rx -> export and removed extra call to _setup_e
| | | | * | 50f8908 2013-12-02 23:18:20 -0600 [Wes Turner]
| | | | | | Updated .bashrc.venv.sh: declare -rx -> export
| | | | * | 209eeda 2013-12-02 21:40:07 -0600 [Wes Turner]
| | | | | | Commented out try/except import sympyprinting
| | | | * | df6f568 2013-12-02 20:21:58 -0600 [Wes Turner]
| | | | | | Updated .hgignore: added etc/vim
| | | | * | 5bfd4fd 2013-12-02 20:19:05 -0600 [Wes Turner]
| | | | | | Added scripts/setup_bashdb.sh
| | | | * | b839e06 2013-12-02 19:44:12 -0600 [Wes Turner]
| | | | | | Added etc/elinks.conf
| | | | * | 83da9ee 2013-12-02 19:43:11 -0600 [Wes Turner]
| | | | | | Updated screensaver.sh: i3lock forks (and works with _suspend_to_ram)
| | | | * | 4dc4c48 2013-11-29 08:07:36 -0600 [Wes Turner]
| | | | | | Always xlock (i3lock = intelligence)
| | | | * | 47a78c7 2013-11-29 08:07:18 -0600 [Wes Turner]
| | | | | | Added .xinitrc and _install_screensaver function
| | | | * | 21e9ce0 2013-11-29 06:27:21 -0600 [Wes Turner]
| | | | | | Updated twitter-add_tweet_link.js to point to https://twitter.com/intent/tweet

```

```

| | | | * | c847117 2013-11-29 06:26:42 -0600 [Wes Turner]
| | | | | | Moved twitter-add_share_link.js to twitter-add_tweet_link.js
| | | | * | f7adede 2013-11-29 06:22:26 -0600 [Wes Turner]
| | | | | | Added twitter-add_share_link.js to css/ folder
| | | | * | 4d3468c 2013-11-29 06:01:17 -0600 [Wes Turner]
| | | | | | Added twitter-hide_sidebar.css
| | | | * | b1e0504 2013-11-29 06:01:03 -0600 [Wes Turner]
| | | | | | Added gmail-hide_sidebar.css
| | | | * | ba085ee 2013-11-29 04:55:46 -0600 [Wes Turner]
| | | | | | Updated ls aliases and check for MVIMBIN. TODO: set a more generic variable for OSX
| | | | * | d6017a0 2013-11-29 04:51:18 -0600 [Wes Turner]
| | | | | | +Shift+b launches x-www-browser
| | | | * | 6319880 2013-11-29 00:47:01 -0600 [Wes Turner]
| | | | | | Added listpath.sh
| | | | * | 3687cee 2013-11-29 00:45:00 -0600 [Wes Turner]
| | | | | | Added nowireless.sh dbus script
| | | | * | f5a6534 2013-11-29 00:44:43 -0600 [Wes Turner]
| | | | | | Added pianobar_install.sh
| | | | * | 3f2e64b 2013-11-29 00:43:49 -0600 [Wes Turner]
| | | | | | Added setup_f.lux.sh
| | | | * | 8824cb1 2013-11-29 00:42:53 -0600 [Wes Turner]
| | | | | | Added screensaver configuration
| | | | * | e19002b 2013-11-11 14:37:14 -0600 [Wes Turner]
